SECTION AT VANE NO. 6 POSITION  
Attachment of Inner and Outer Cases and Positioning  
of Pins and Bolts  
Figure 504

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

D. Attach the Inner Case to the Outer Case (Ref.Fig.504).

- (1) Turn the inner diffuser so that the pair of small drain holes between vanes No.5 and 6 are positioned 180 deg from the shouldered pin on the rear flange of the outer case. Screw up the jacking fixture until the locating pin positions in the inner and outer cases are aligned. Insert the 10 (slave) locating pins (Tool 300) in the rear (upper) ring of holes through the outer case and into the vanes of the inner case.
- (2) Lightly smear the diameters of the hollow pins (4-180) with lubricant 'A'. In sequence remove the slave locating pins from the rear holes and insert a hollow pin ensuring that the flat engages with the corresponding flat on the case. For vanes No.5 and 6, apply jointing compound 'A' to the casing flange under the head of the hollow pin.
- (3) Apply lubricant 'A' to the 20 trunnion nuts (4-190), then insert two trunnion nuts into the two holes in each vane and align the tapped hole in each nut with the holes in the outer casing.
- (4) Apply lubricant 'A' to 10 of the retaining bolts (4-160), then insert the bolts through the hollow pins and screw the bolts into the trunnion nuts.
- (5) Apply lubricant 'A' to the remaining 10 bolts and assemble a locking plate (4-170) to each bolt. Insert the bolts into the front (lower) hole at each vane station and screw them into the trunnion nuts, ensuring that the flats of the locking washers engage with the corresponding flats on the case. At vanes No.5 and 6, apply sealing compound 'A' to the case flange under the locking washer.
- (6) Torque-tighten the 20 retaining bolts between 330 and 370 lbf in. (37,3 and 41,8 N.m).
- (7) Wire-lock each bolt to either its locking plate or hollow pin.

- (8) Position the mobile stand (Tool 811) under the jacking fixture (Tool 299). Take the weight of the fixture, release the fixture nuts and withdraw the clamps, then lower the fixture onto the mobile stand. Remove the stand/fixture from under the mounting plate.

E. Prepare the Cooling Air Feed and Hot Air Vent Duct Assemblies for Assembly to No.2, 4 and 7 Vane Positions (Ref.Fig.505).

- (1) Check that the sealing ring gaps are within the limits specified in the Fits and Clearance Schedule F.C.S.254.
  - (a) Assemble the sealing rings (1-130, 1-300 and 2-200) into their respective seal housings (1-90, 1-260 and 2-160) and air feed and vent sockets (72-52-03/2-20 and 2-40).
  - (b) Measure the sealing ring gaps and compare the result with the Fits and Clearance Schedule F.C.S.254.
  - (c) Remove the sealing rings from the items and note the positions at which they were checked.
- (2) Lubricate the six sealing rings (1-130, 1-300 and 2-200) with lubricant 'B', then assemble them to the grooves at each end of the seal carriers (1-140, 1-310 and 2-210). Trial assemble each seal carrier to its seal housing (1-90, 1-260 and 2-160) and to the air feed socket (72-52-03/2-20) or vent socket (72-52-03/2-40), on the bearing housing, as applicable. Compress the sealing rings and ease the carrier/ring into the housing and socket, ensure that the sealing rings are assembled to the positions at which they were gap checked (Ref.(1), (c)). Leave the carriers assembled to the air feed and vent sockets, but withdraw them slightly from full engagement to facilitate alignment when the seal housings are assembled.

OVERHAUL

- (3) If the air duct assemblies are to SB.72-130 standard (1-60C, 1-230C and 2-130C), assemble two bolts (1A-80B, 1A-250B and 2-150B), as applicable, with lubricant 'A' applied, to the inner flange of each duct. Enter the bolts through the duct flanges towards the centre of the exhaust diffuser and ensure that the bolt threads pass fully through the threads in the flange.

F. Assemble the Cooling Air Feed and Hot Air Vent Duct Assemblies to No.2, 4 and 7 Vane Positions (Ref.Fig.505).

- (1) Install the air duct (1-60) into the No.2 vane.
- (a) On pre-SB.72-129 air ducts (1-60A), insert the air duct assembly into the hole in the outer case in line with No.2 vane, then guide the duct through the vane and locate the outer flange over the six bolts which protrude through the outer case. Temporarily secure the outer flange with four (slave) nuts (1-10). Examine the inner end of the duct to ensure that a clearance of not less than 0.070 in. (1,77 mm) exists between each side of the duct and the vane.
  - (b) On SB.72-129 standard air ducts (1-60B), insert the air duct assembly into the hole in the outer case in line with No.2 vane. Ensure that the off-set portion of the duct is positioned towards the convex outer surface of the vane, then guide the duct through the vane and locate the outer flange over the six bolts which protrude through the outer case. Temporarily secure the outer flange with four (slave) nuts (1-10). Examine the inner end of the duct to ensure that the following clearances are present.
    - (i) A minimum clearance of 0.010 in. (0,254 mm) between the duct and the vane on the off-set side of the duct.
    - (ii) A minimum clearance of 0.150 in. (3,81 mm) between the duct and the vane throughout the off-set length of the other side of the duct.
- (2) Install the air ducts (1-230 and 2-130) into the No.4 and 7 vanes.

- (a) Assemble a gasket (1-225) over the end of the air duct (1-230) and rest it on the duct flange, ensuring that the contour of the gasket outer edge aligns with the outer edge of the duct flange. Assemble a gasket (2-125) to the air duct (2-130) ensuring that outer edge contours align.
  - (b) Assemble the air ducts (1-230 and 2-130) into the vanes as detailed in para.(1)(a) or (b), ensuring that each gasket is carefully located over the outer case bolts. Use the (slave) nuts (1-170 and 2-80) to secure the outer flanges temporarily, then ensure that the clearances given in (1)(a) or (b)(i) and (ii) (as applicable) exist.
- G. Assemble Seal Housings to Cooling Air Feed and Hot Air Vent Duct Assemblies (Ref.Fig.505).
- (1) Assemble the seal housings (1-90, 1-260 and 2-160) to the inner ends of their respective ducts, ensuring that the locking plate attachment flange on each housing faces rearward.
    - (a) On pre-SB.72-130 ducts, apply lubricant 'A' to the bolts (1-80, 1-250 and 2-150), then assemble two bolts to each housing and screw them into the threaded inserts in each duct flange.
    - (b) On SB.72-130 standard ducts, secure each seal housing to its duct with two nuts (1A-75, 1A-245 and 2-145), using the cranked ring wrench (Tool 1992) to immobilize the bolts when torque-tightening the nuts.
    - (c) Ensure that the locking (run-down) torque of the nuts or bolts is not less than 3.5 lbf in. (0,4 Nm), then torque-tighten to 100 lbf in. (11,5 N.m). Release the outer end of each duct, withdraw the ducts as far as the seal housings will allow, then rest each duct in that position.
- H. Assemble the Bearing Housing to the Inner Case (Ref. Fig.506).

OVERHAUL

- (1) Prepare the two seal housings in the bearing housing as follows:
  - (a) Unscrew and remove the locating pin.
  - (b) Apply lubricant 'C' to the bolt (72-52-03/2-70), screw the bolt into the vacant hole and torque-tighten it to 100 lbf in. (11,5 N.m).
  - (c) Attach two pieces of locking wire to the bolt just assembled in preparation for locking to the other two bolts.
  - (d) Remove the other two bolts and position the locking wire clear of the flange.
- (2) Turn the stand so that diffuser mounting flange is vertical, with No.1 and 10 vanes uppermost. From the forward end of the diffuser offer the bearing housing, with its 'TOP' position uppermost and cover assembly leading, so that the bearing housing flange locates against the internal flange of the diffuser.

NOTE: The bearing housing must be supported until the bolts are assembled.
- (3) Apply lubricant 'C' to the 20 bolts (72-52-03/2-210), then insert the bolts from the rear of the inner case, through the case and bearing housing flanges locating the bolthead flats against the step. Screw nuts (72-52-03/2-200) onto the bolts, ensuring that the locking (run-down) torque is not less than 6.5 lbf in. (0,7 N.m), then torque-tighten the nuts to 210 lbf in. (24 N.m).

J. Assemble the Hot and Cold Air Ducts to the Bearing Housing Cover (Ref.Fig.505 and 506).

- (1) Assemble the cooling air feed duct in No.2 vane.
  - (a) Move the cooling air feed duct assembly into No.2 vane so that the seal housing at its inner end engages the seal carrier (1-140) resting in the air feed socket on the bearing housing.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

PRINTED IN ENGLAND

- (b) Ease the seal housing under the locking plate (1-120), then push the duct fully home so that the seal carrier enters the seal housing, and the flange on the outer end of the duct engages the six trapped bolts in the outer case.
  - (c) Lubricate the two bolts (1-100) with lubricant 'A' and assemble a washer (1-110) onto each bolt. Align the tapped holes in the duct seal housing with the locking plate holes, and screw in the bolts.
  - (d) Temporarily secure the outer end of the duct with four (slave) nuts (1-10), then torque-tighten the locking plate bolts to 100 lbf in. (11,5 N.m). Wire-lock the bolts to each other.
- (2) Assemble the hot air vent duct in No.4 vane.
- (a) Move the hot air vent duct assembly into No.4 vane so that the seal housing at its inner end engages the seal carrier (1-310) resting in the vent socket on the bearing housing.
  - (b) Ease the seal housing under the locking plate (1-290), then push the duct fully home so that the seal carrier enters the seal housing, and the flange and gasket on the outer end of the duct engage the six trapped bolts in the outer case.
  - (c) Lubricate the two bolts (1-270) with lubricant 'A' and assemble a washer (1-280) onto each bolt. Align the tapped holes in the duct seal housing with the locking plate holes and screw in the bolts.
  - (d) Temporarily secure the outer end of the duct with four (slave) nuts (1-170), then torque-tighten the locking plate bolts to 100 lbf in. (11,5 N.m). Wire-lock the bolts to each other.

(3) Assemble the hot air vent duct in No.7 vane.

- (a) Move the hot air vent duct assembly into No.7 vane so that the seal housing at its inner end engages the seal carrier (2-210) resting in the vent socket on the bearing housing.
- (b) Ease the seal housing under the locking plate (2-190), then push the duct fully home so that the seal carrier enters the seal housing and the flange and gasket on the outer end of the duct engage the six trapped bolts in the outer case.
- (c) Lubricate the two bolts (2-170) with lubricant 'A' and assemble a washer (2-180) to each bolt. Align the tapped holes in the duct seal housing with the locking plate holes and screw in the bolts.
- (d) Temporarily secure the outer end of the duct with four (slave) nuts (2-80), then torque-tighten the locking plate bolts to 100 lbf in. (11,5 N.m). Wire-lock the bolts to each other.

K. Assemble the Oil Feed Tube Assembly to No.6 Vane Position (Ref.Fig.507).

- (1) Ensure that the seal housing (2-40) and tube (2-30) are both to the same service bulletin standard, then trial assembly the housing over the tube to ensure that the housing slides easily over the mating part at the outside end of the tube.
- (2) On engines to pre SB.72-8588-218 standard ensure that the tube meets the requirements of SB.72-8712-119.
- (3) Apply lubricant 'A' to the jet guard (2-25) (SB.72-48 standard only), then screw it into the inner end of the oil tube assembly and torque-tighten to 30 lbf in. (3,4 N.m).
- (4) Slide the union nut (2-10), seal housing (2-40) and gasket (2-75) over the barrel nut end of the tube (2-30), and slide them to the other end of the tube.
- (5) Apply lubricant 'B' to each seal of the seal ring assembly (2-20).

OVERHAUL

- (6) With an outward spring assembled first, assemble the four seal rings to the groove in the barrel nut with the remaining inward and outward sprung rings in alternate sequence.
- (a) Screw the four rings, in turn, along the nut thread and ease them into the nut groove.
- (7) Apply lubricant 'C' to the cover bolt (72-52-03/2-60), insert the bolt through the clamp bolt-hole and screw the nut (72-52-03/2-50) onto the bolt. Do not tighten the nut.
- (8) Lubricate the barrel and threads with lubricant 'A'.
- (9) Insert the barrel nut end of the tube into the forward round hole through the outer case into No.6 vane, guide the tube through the vane and at the same time, locate the gasket (2-75) and seal housing (2-40) over the three bolts protruding through the outer case.
- (10) When the barrel nut protrudes through the inner end of the vane, position the cover (72-52-03/2-90) over the end of the nut, and feed the nut through the cover into the seal housing (2-40).
- (11) Position the tube in the vane.
- (a) Turn tube to align barrel nut with housing and, with a tube to SB.72-101 standard, turn so that tube bend contacts the inner edge of the vane convex face.
- NOTE: Tubes to SB.72-101 and SB.72-8588-218 standard are bent whereas tubes to pre SB.72-101 are straight and run centrally through the vane (Ref.Fig.507).
- (12) Pull the cover clear of the barrel nut, then push the tube into the vane so that the nut enters the seal housing.
- (13) Screw the barrel nut into the seal housing by hand then using the nut runner (Tool 1049) lightly tighten.
- (a) Assemble the nut runner to the barrel nut and insert the holder (Tool 846) between the runner and the tube shoulder to engage with the flats on the tube.

OVERHAUL

- (b) Use the holder to maintain the tube in the set position within the vane and with a suitable tommy bar to turn the runner, lightly tighten the nut.
- (14) With lubricant 'C' applied, screw the three nuts (2-50) on to the outer case bolts and torque-tighten to 100 lbf in. (11,5 N.m). Ensure the locking (run-down) torque is not less than 3,5 lbf in. (0,4 N.m).
- (15) Establish the tightening force to be applied that will result in a tightening torque of between 280 and 310 lbf in. (32 and 35 N.m) at the barrel nut. Position the spanner(s) and torque wrenches (Tool 1046, 1047) on the torque adapter (Tool 871) to the checking fixture in accordance with 72-09-00 assembly with the same angle and manner of application as to be used on the nut. Note the load applied on the torque wrench that gives the required nut torque-tightening.
- (16) Retain the tube in position with the holder (Tool 846) engaged with the flats at the inner end of the tube and with the spanners, to be used alternately as required and torque wrench apply the pre-determined torque load required to tighten the nut to between 280 and 310 lbf in. (32 and 35 N.m).
- (17) Wire-lock the nut to one of the three holes in the inner lip of the seal housing. Position the locking wire to allow the cover to slide over the tube and abut the seal housing.
- (18) Insert locking wire through the locking wire hole in the seal housing rear bolt, of sufficient length, to wire-lock the two securing bolts at a later stage.
- (19) Slide the cover over the tube and into abutment with the seal housing and, with the clamp nut and bolt to the rear, align the attachment bolt-holes.
- (20) With lubricant 'B' applied, secure the cover with two bolts (72-53-03/2-80) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock the bolts to the rear bolt in the seal housing using the locking wire already attached.
- (21) Torque-tighten the clamp nut and bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Ensure the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

L. Assemble the Cold Air Vent Tube Assembly to No.5 Vane Position (Ref.Fig.507 and 508).

- (1) Apply lubricant 'B' to each seal of the seal assembly (1-410), then assemble the seal ring assembly to the groove in the barrel nut by screwing the four rings (in turn) along the nut thread, then easing them into the nut groove. Ensure that outward sprung rings alternate with inward sprung rings with an outward sprung ring assembled first.
- (2) Apply lubricant 'C' to the cover bolt (72-52-03/2-60), then insert the bolt through the cover clamp bolt hole and screw the nut (72-52-03/2-50) onto the bolt but do not tighten the nut. Lubricate the barrel nut threads with lubricant 'A', then insert the barrel nut end of the tube into the forward hole through the outer case into No.5 vane and guide the tube through the vane. When the barrel nut protrudes through the inner end of the vane, position the cover (72-52-03/2-90) over the end of the nut, and feed the nut through the cover into the seal housing (72-52-03/2-100). Turn the tube as required to align the barrel nut with the housing and position the tube centrally within the vane. Pull the cover clear of the nut, push the nut into the seal housing and screw the nut into the bearing housing by hand.
- (3) Assemble the nut runner (Tool 1049) to the barrel nut, with the holder (Tool 846) between the runner and the tube shoulder engaged with the flats on the tube. Ensure that the outer end of the tube is central in the hole, then tighten the nut using a suitable tommy bar to turn the runner. Confirm the correct positioning of the outer end of the tube by assembling the adapter (Tool 1957) to the four bolts in the outer case. If necessary loosen the barrel nut, move the tube assembly until correctly positioned and retighten the nut. Remove the holder and runner. Using adapter (Tool 871), check the torque setting of the open end wrench (Tool 625, 626), then using the wrench and holder (Tool 846), torque-tighten the nut between 280 and 310 lbf in. (31,6 and 35,0 N.m). Re-assemble the adapter to the outer case and confirm that the tube assembly is correctly positioned. Rectify as necessary by repositioning. Wire-lock the barrel nut to a locking hole in the seal housing, then remove the adapter and blank the end of the tube.

- (4) Ensure that the locking wire attached to the seal housing rear bolt is clear of the flange, then slide the cover along the tube and engage it with the seal housing, ensuring that the bolt holes align and the clamp nut and bolt face the rear. Lubricate the two bolts (72-52-03/2-80) with lubricant 'C', then insert the bolts into the cover and screw them into the anchor nuts of the cover assembly. Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock to the rear bolt using the locking wire already attached. Torque-tighten the clamp nut and bolt to 100 lbf in. (11,5 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

M. Assemble the Bearing and Rear Cover Assembly to the Bearing Housing (Ref.Fig.509).

- (1) Slide the LP turbine bearing outer race/rollers (72-52-03/2-140) into the bearing housing locating the bearing dogs into the slots in the housing. Offer the retaining ring (72-52-03/2-220) whose clamping dimension was previously determined in 72-52-03 Assembly, to abut the bearing with its smaller diameter entering first, then align a cutaway in the retaining ring with the oil passage hole at the No.6 vane position in the bearing housing.
- (2) Apply jointing compound 'C' or 'D' thinly to the front face of the rear cover (72-52-03/1-160). Locate the rear cover front face over the securing bolts of the bearing housing with the locating pin on the housing aligned with the hole in the cover flange, and ensure by viewing into the cover that the oil tube enters the oil hole in the bearing housing. Ensure that the rear cover flange locates correctly within the cover assembly rear flange and abuts the bearing housing, if necessary, by using a light alloy drift and hammer. Apply lubricant 'A' to the nuts (72-52-03/1-170) screw the nuts onto the bolts, then using the cranked ring wrench (Tool 1584), torque-tighten the nuts to 100 lbf in. (11,5 N.m), ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

OVERHAUL

- (3) Apply lubricant 'C' to the 12 securing bolts (72-52-03/1-60) and apply jointing compound 'C' or 'D' thinly to the flange face of the (end) cover. Assemble the (end) cover to the rear cover locating the oil block assembly over the oil tube assembly and the (end) cover locating pin hole over the locating pin. Ensure that the end cover abuts the rear cover flange, then insert the securing bolts into the (end) cover and screw them into the captive nuts. Torque-tighten the bolts to 100 lbf in. (11,5 N.m) using the cranked ring wrench (Tool 1584), ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

NOTE: The (end) cover is removed at final build for setting up the actuator arm, but the torque-tightening of the bolts at this stage enables the oil pressure test to be carried out.

- N. Assemble the Oil Scavenge Tube Assembly to No.5 vane Position (Ref.Fig.507).

NOTE: If seal housing and tube are new items ensure that housing and tube are both to the same service bulletin standard, then trial assemble the housing over the tube to ensure that the housing slides easily over the mating part at the outside end of the tube.

- (1) On engines to pre SB.72-8588-218 standard ensure that the tube meets the requirements of SB.72-/119.
- (2) Place the union nut (1-320) seal housing (1-340) and gasket (1-375) over the threaded end of the tube.
- (3) Apply lubricant 'A' to the tube threads.

SUB-ASSEMBLY

## 72-53-00

Page 526

Dec 31/01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (4) Insert the tube into the rear hole in the outer case in line with No.5 vane and if tube ends are marked 'REAR' or have a machined flat, ensure that these markings remain facing rearward when guiding the tube through the vane.

NOTE: Dependent on Service Bulletin standard, tube ends will be either unmarked, marked 'REAR' at both ends, or 'REAR' at the inner end with a machined flat at the outer end.

- (5) Engage the ferrule of the rear cover sump pipe (72-52-03/1-210) and at the same time locate the gasket and the seal housing at the other end of the tube over the three bolts protruding through the outer case.
- (6) Screw the sump pipe union nut onto the tube but do not tighten at this stage.
- (7) With lubricant 'C' applied, screw the three nuts (1-350) onto the outer case bolts and torque-tighten to 100 lbf in. (11,5 N.m). Ensure the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).
- (8) Establish the tightening force to be applied that will result in a tightening torque of between 310 and 340 lbf in. (35 and 38 N.m) at the nut. Position the spanner and torque wrench (Tool 872) on the torque adapter (Tool 322) to the checking fixture with the same angle and manner of application as to be used on the nut, note the load applied on the torque wrench that gives the required nut torque-tightening.
- (9) On engines to SB.72-101, 72-8440-194, 72-8588-218 or 72-8790-306 standard, position the tube in the vane (Ref.Fig.510).

CAUTION: POSITION TUBE STRICTLY AS SHOWN WITH 'REAR' MARKINGS OR MACHINED FLAT FACING REARWARD. HEAVY FRETTING COULD OCCUR ON TUBES THAT ARE INCORRECTLY POSITIONED.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Turn the tube so that its bend contacts the inner edge of the vane convex face and verify that the 'REAR' markings or machined flat (if incorporated on the tube ends) remain facing rearward.

NOTE: Tubes to SB.72-101, 72-8440-194, 72-8588-218 and 72-8790-306 standard are bent whereas tubes to pre SB.72-101 are straight and run centrally through the vane.

- (10) Retain the tube in position with open ended wrench (Tool 906) engaged with the flats at the inner end of the tube and with the torque wrench (Tool 872) apply the predetermined torque load required to tighten the nut to between 310 and 340 lbf in. (35,0 and 38,4 N.m).

- (11) Wire-lock the union nut to the tube.

- (12) Blank off the external end of the tube.

### 3. Pressure Test and Oil Flow Check the LP Turbine Bearing Support

#### A. Description of the Oil Supply Equipment.

- (1) A mobile oil pressure test rig (Tool 1926), associated pipes (Tool 3073), and a flow check unit (Tool 3074) will be required, or if not available, a test rig that contains, and is capable of producing the following facilities will be required.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) An oil heater capable of heating the oil in excess of 120 deg C and a temperature gauge capable of registering the temperature.
- (b) A pump capable of flowing 85 gal/h (Imp.) (368 l/h) of oil at a pressure of 50 psi (345 kPa), and a means of checking the rate of flow.
- (c) A pressure control valve, flow and return connections and stop valves.
- (d) A method to prevent the spread of hot oil noxious fumes into the work area.

B. Assemble the Pressure Test Equipment to the Turbine Exhaust Diffuser (Ref.Fig.512).

- (1) Assemble the pressure test blank to the bearing housing (Ref.Fig.512).

NOTE: Two alternative blanks are available, and two standards of support, with and without a bolting flange. The procedure for using blank (Tool 295) is detailed in para.(a), (c) and (d), and for blank (Tool 1958) in para.(b), (c) and (e).

- (a) Check that the sealing ring assembled between the two pads of blank (Tool 295) is in a serviceable condition (70-80 Shore hardness rubber ring, 0.250 in. (6,35 mm) diameter cross section, 5 in. (127 mm) inside diameter). Slacken the three nuts, then insert the blank into the inner (No.30) labyrinth in the front of the bearing housing.
- (b) Check that the sealing ring assembled in the recess of blank (Tool 1958) is in a serviceable condition (Standard O-seal, FBS-68-E7-8-9). Insert the blank into the inner (No.30) labyrinth in the front of the bearing housing so that the sealing ring abuts the front face of the labyrinth.
- (c) Assemble the pressure test blank support (Tool 296) to the mounting plate, screwing the two captive bolts into the two tapped holes near the cutaways on the mounting plate.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (d) Withdraw the blank (Tool 295) until it rests against the central stop of the support, or against the three bolts of the flanged support. Rotate the blank until the extension tube is uppermost, then tighten the three nuts of the blank to expand the seal against the labyrinth. Ensure that the three bolts of the flanged blank are set to hold the blank squarely within the labyrinth with the seal adequately engaged.
- (e) Rotate the blank (Tool 1958) so that the extension pipe is uppermost, then tighten the three bolts of the flanged support to compress the blank seal against the front face of the labyrinth.

NOTE: The support without a bolted flange cannot be used with the blank (Tool 1958).

NOTE: It is essential that no leak occurs from the blank, otherwise it will drain into the space between the labyrinth and into the cold vent tubing, giving the false indication that the bearing housing is defective and leaking. It is suggested that a sheet of blotting paper (or similar absorbent material, the marking of which is readily noticeable), be inserted between the labyrinths under the blank and examined for evidence of leaks from the blank during the pressure testing.

- (2) Remove the blanks from the oil pressure tube in No.6 vane and the oil scavenge (rear) tube in No.5 vane, screw an adapter (Tool 703) into each tube, and tighten the tube union nuts using a crowfoot wrench (Tool 1534).
- (3) Connect the test rig delivery pipe to the adapter or tube in No.6 vane, then connect the return pipe to the adapter or (rear) tube in No.5 vane. Ensure that the connections are tightened fully.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

C. Pressure Test the LP Turbine Bearing Support.

- (1) Connect the test rig to the mains power supply, then switch on the rig heater and allow the oil to heat to 120 deg C.
- (2) Loosen the bleed connection on the extension tube of the blank, and position a suitable container to ensure that oil from the bleed will not run down the extension tube onto the bearing housing.
- (3) With the return stop valve open, flow oil through the assembly. When the oil flowing from the bleed is free of air, close the bleed and continue flowing oil until the assembly has warmed to the required oil temperature of 120 deg C.
- (4) Close the stop valve in the return line and set the pressure to 10 psig (69 kPa). Check that there is no leak from the pressure test blank, by examining for witness on the paper (if used), and rectify if necessary. Maintain the pressure at 10 psig (69 kPa) for 30 minutes, occasionally opening the stop valve in the return line to circulate hot oil to maintain the assembly at not less than 80 deg C.

NOTE: The period of 30 minutes is necessary to ensure that any defect in the bearing housing will develop into a leak from the cold air vent in No.5 vane.

- (5) During the (30 min) period of the pressure test, check for evidence of oil leaks. These could be external leaks from the oil tubes, the bolted flanges at either end of the rear cover (or from the actuating arm shaft), or internal leaks which will appear as oil between the labyrinths or at the outlet from the cold air vent tube at No.5 vane. No leakage is permitted, but slight seepage is allowed (see NOTE). If no leaks occur after 30 minutes, proceed with the oil flow check (Ref. para.E). If oil leaks are evident, shut down the rig and release the pressure, then rectify the defect (Ref. para.D).

NOTE: An oil leak is considered as drops or globules of oil forming within 15 min. of the assembly being subjected to the test pressure, and a seepage is considered a dampness that does not form a droplet or globule until the assembly has been subjected to the test pressure for more than 15 min.

OVERHAUL

D. Rectification of Pressure Test Oil Leakage.

- (1) If leakage occurs from the actuating arm shaft (Ref. Fig.514) proceed as follows:
  - (a) On engines to pre SB.76-2 standard, torque-tighten the nut on the actuating arm shaft to its top limit value of 145 lbf in. (16,4 N.m). On engines to SB.76-2 standard, remove the split pin and torque-tighten the nut to 130 lbf in. (14,7 N.m), further tighten to align the castellated nut with the split pin hole and assemble a new split pin. Repeat the pressure test to check if the leak is still present.
  - (b) If the shaft nut was already fully tightened, or leakage persists after tightening, disconnect the rig return pipe from the adapter or oil scavenge tube and allow the oil to drain from the rear cover (into a container), opening the bleed on the blank extension to allow air to enter.
  - (c) If the leakage is only from the shaft retaining nut side of the sump, support the shaft, then unscrew and remove the nut having removed the split pin on engines to SB.76-2 standard. Withdraw the retainer and seal, then assemble a new (serviceable) seal to the retainer and assemble them into the cover and onto the shaft ensuring that the seal locates correctly in the groove in the sump. On engines to pre SB.76-2 standard, screw the nut onto the shaft, having applied lubricant 'B', then torque-tighten the nut between 135 and 145 lbf in. (15,3 and 16,4 N.m) ensuring that the locking (run-down) torque is not less than 6.5 lbf in. (0,7 N.m). On engines to SB.76-2 standard, screw the nut onto the bolt, having applied lubricant 'B', then torque-tighten the nut between 120 and 130 lbf in. (13,6 and 14,7 N.m). Further tighten the nut to align the castellations with the split pin hole, then lock the nut with a split pin (76-21-02/1A-500).

# OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (d) If the leakage occurs from both sides, or from the actuating arm side, proceed as follows:
- (i) Release and remove the (end) cover. Supporting the actuating arm, release and remove the shaft nut, remove the retainer and seal from one side and the shaft and seal from the other side and in addition, the bolt if SB.76-2 (Part 1) is embodied, or the bolt and sleeve if SB.76-2 (Part 2) is embodied. Discard the leaking seal or seals.
  - (ii) Offer the shaft, with a serviceable seal assembled, into the sump and engage it with the arm, aligning the master splines. Locate the seal in the sump groove with the shaft holding it in place, then assemble the retainer to hold a serviceable seal in the groove on the other side of the sump. On engines to pre SB.76-2 standard, screw the nut onto the shaft, having applied lubricant 'B', then torque-tighten between 135 and 145 lbf in. (15,3 and 16,4 N.m) ensuring that the locking (run-down) torque is not less than 6.5 lbf in. (0,7 N.m). On engines to SB.76-2 standard enter the bolt through the shaft if Part 1 is embodied, or through the sleeve and shaft if Part 2 is embodied, then screw the castellated nut onto the bolt having applied lubricant 'B'. Torque-tighten the nut between 120 and 130 lbf in. (13,6 and 14,7 N.m), then further tighten the nut if necessary to align it with the split pin hole. Lock the nut with a split pin.
  - (iii) Using sealing compound 'C', assemble the (end) cover to the rear cover, locating the oil block assembly over the oil tube assembly in the rear cover, and the locating pin in its hole in the (end) cover. Ensure that the end cover abuts the rear cover flange, then with lubricant 'C' applied, secure with the 12 bolts (72-52-03/1-60). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

SUB-ASSEMBLY

## 72-53-00

Page 534

Dec 31/01

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (e) Having replaced the seal(s), connect the test rig return line to the adapter or oil scavenge tube, then repeat the pressure test procedure of para.C.
- (2) Leakage may occur from the flanged joints at the forward or rear end of the rear cover. At the forward end this may result in oil witness at the flange, or as oil in the spaces between No.27, 28 or 29 labyrinths. At the rear end, leakage will appear as an oil witness at the flange. After draining the assembly (Ref. para.(1)(b)), disassemble to uncover the leaking joint, remove the sealing compound 'C', then clean and examine both sealing faces. If clear of damage, remake the joint, reassemble (Ref. para.2.M), and retest. If leakage persists, repeat the disassembly procedure, and check the flange faces for flatness. Rectify or replace faulty components, reassemble and retest.
- (3) Leakage from the oil scavenge tube joint may be detected by examining the tube close to the rear cover. To rectify leakage from the scavenge oil tube joint, drain the oil from the bearing housing (Ref. para.(1)(b)), remove the tube, clean and examine the sealing faces, then reassemble the tube. Repeat the pressure test.
- (4) Leakage from the cold air vent tube may be due to a leak from the blank into the space between No.29 and 30 labyrinths, a leak at the oil pressure feed tube/bearing housing joint, or a faulty bearing housing.
- (a) To determine whether the blank is leaking, drain the oil from the housing (Ref. para.(1)(b)), remove the blank and vent tube, dry the items and between the labyrinths and reassemble the blank. Repeat the pressure test, ensuring that spillage does not drain into the space between No.29 and 30 labyrinths.

**72-53-00**

Page 535  
Aug 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (b) To determine whether the leak originates at the oil pressure tube joint, drain the oil from the bearing housing assembly (Ref. para. (1)(b)). Remove the blankets (72-52-03/2-43, 47), if the assembly is to SB.72-20 standard, by cutting and removing the wire-locking on the upper locations only and folding the blankets open using the lower wire-locking as a hinge. Loosen the clamp bolt, remove the two bolts (72-52-03/2-80), and slide the seal housing back along the tube. If oil is present in the seal housing, unscrew the barrel nut, release the three nuts (2-50) at the outer case, and withdraw the oil tube. Clean and examine the sealing face of the tube, then reassemble (Ref. para. 2.K) and repeat the pressure test.
- (c) If leakage from the cold vent tube is still present, in situ rectification is not possible as the LP turbine bearing housing is faulty and must be changed as follows:
- (i) Drain the oil from the housing (Ref. para. (1)(b)).
  - (ii) Disconnect the test rig from the diffuser and remove the blank (Ref. para. G).
  - (iii) With reference to the appropriate para., remove the LP turbine bearing support from the turbine exhaust diffuser (Ref. 72-53-00 Disassembly).
  - (iv) Disassemble the LP turbine bearing support (Ref. 72-52-03 Disassembly).
  - (v) Assemble the LP turbine bearing support (Ref. 72-52-03 Assembly), using a replacement bearing housing.
  - (vi) Assemble the items of the LP turbine bearing support to the turbine exhaust diffuser in accordance with the appropriate parts in this Chapter.
  - (vii) On completion of the assembly to the stage required, carry out an oil pressure test.

TN21469

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (5) Having carried out the appropriate rectification and achieved a satisfactory oil pressure test with no leaks, carry out a flow check.

E. Flow Check the LP Turbine Bearing Support.

- (1) With the test rig delivery and return pipes connected to the diffuser oil scavenge and pressure tubes, and the oil at a temperature of 120 deg C., open the stop valves in the delivery and return lines and circulate the oil through the bearing housing assembly at 48 psi (330 kPa) delivery pressure for (approx.) 15 min.
- (2) Disconnect the rig return pipe at the rig, and collect the return oil for an accurately timed period of one min. in a suitable (measuring) container. Reconnect the return pipe to the rig, then shut down the rig and release the pressure.

NOTE: The disconnection of the return pipe may be made at the adapter or oil tube if it is not convenient to disconnect at the test rig, which is quoted because of the convenience of collecting spillage during the disconnection.

- (3) Check the quantity of oil collected in the container. The oil flow must be between 53 and 63 gal/h (Imp.) (241 and 287 l/h) on engines to pre SB.72-40 standard, or between 73 and 83 gal/h (Imp.) (332 and 377 l/h) on engines to SB.72-40 standard. If the oil flow is incorrect, carry out a further oil flow check and ensure that the oil is at a temperature of 120 deg C. and that the delivery pressure is 48 psi (330 kPa). If the oil flow is still incorrect, refer to para.F.

F. Rectification of Incorrect Oil Flow.

- (1) If the oil flow is incorrect, check that the rear cover oil tube jet is the correct size for the SB. standard incorporated, then check the bearing housing jet holes (Ref.para.(2)).
  - (a) Disconnect the rig return pipe from the adapter or oil scavenge tube, and allow the oil to drain from the rear cover (into a container), opening the blank bleed to admit air.

SUB-ASSEMBLY

OVERHAUL

SNECMA

- (b) Release and disconnect the oil scavenge tube in No.5 vane from the sump of the rear cover.
  - (c) Unscrew and remove the nuts securing the rear cover, using the cranked ring wrench (Tool 1584), then withdraw the cover from the bearing housing, lightly tapping the edge of the rear cover rear flange (if necessary) to release the cover.
  - (d) Withdraw the bearing retaining ring and bearing from the bearing housing.
  - (e) Check the jet size of the oil tube in the rear cover. On engines to pre SB.72-40 standard, the diameter should be 0.077 to 0.079 in. (1,96 to 2,01 mm), and on engines to SB.72-40 standard, the diameter should be 0.104 to 0.106 in. (2,64 to 2,69 mm). If incorrect, remove the two retaining nuts and bolts and withdraw the oil tube, then release and remove the (end) cover. Insert a serviceable new oil tube (72-52-03/1-120) and secure with two bolts and nuts (72-52-03/1-140 and 130) lubricated with lubricant 'A', then torque-tighten to 100 lbf in. (11,5 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).
- (2) Having checked the jet size in the rear cover oil tube, check that the size of the jet holes in the bearing housing are correct for the SB. standard incorporated (Ref. SB.72-40).
- (a) Withdraw the bearing retaining ring and bearing from the bearing housing.
  - (b) Check the size of the two jet holes into the bearing bore. The diameter of the forward hole should be 0.072 to 0.074 in. (1,83 to 1,88 mm) and the rearward hole 0.125 to 0.127 in. (3,18 to 3,23 mm).
  - (c) Disconnect the test rig delivery pipe from the diffuser, then release and withdraw the oil feed tube assembly (Ref. para.D.(4)(b)).

SUB-ASSEMBLY

- (d) Check the size of the jet hole from the feed tube. On engines to pre SB.72-40 standard, the diameter should be 0.085 to 0.087 in. (2,16 to 2,21 mm), and on engines to SB.72-40 standard, the diameter should be 0.097 to 0.099 in. (2,46 to 2,51 mm).
  - (e) If the jet sizes are correct, reassemble the items to the diffuser (Ref.para.(4)). If incorrect, disassemble the bearing housing (Ref.para.(3)).
- (3) If the jet sizes in the bearing housing are incorrect, assemble a replacement bearing housing as follows, ensuring that it is to the same SB. standard as the rear cover oil tube (Ref.SB.72-40).
- (a) Remove the tubes and ducts, then the LP turbine bearing support from the turbine exhaust diffuser (Ref.72-53-00 Disassembly).
  - (b) Disassemble the LP bearing support (Ref. 72-52-03 Disassembly).
  - (c) Assemble the LP bearing support using a replacement bearing housing (Ref.72-52-03 Assembly).
  - (d) Assemble the LP bearing support, and the tubes and ducts through the vanes (Ref.para.2.H.J.K. and L.).
- (4) Having ensured that the oil jets are the correct size, assemble the items to the exhaust diffuser (Ref.para.2.M. and N.). Reassemble the pressure test equipment (Ref.para.3.B.) and repeat the pressure test and flow check.

G. Remove the Pressure Test Equipment.

- (1) On completion of a satisfactory pressure test and flow check, remove the pressure test equipment.

SUB-ASSEMBLY  
**72-53-00**

MK.610-14-28  
OVERHAUL

- (a) Ensure that the heater is turned off, the oil pressure released and the rig turned off. Disconnect the test rig from the mains power supply and stow the cable on the test rig.
- (b) Open the air bleed on the blank, disconnect the test rig delivery and return pipes from the adapters or the oil tubes, and collect the oil drainage in a clean container returning it to the test rig. Stow the oil pipes on the test rig.
- (c) Unscrew and remove the adapters (if used) from the oil pressure and scavenge tubes using the crow-foot wrench (Tool 1534).
- (d) Release and remove the test blank support from the mounting plate. Release the nuts and withdraw the blank from the labyrinth, or release the three bolts on the test blank support, then release and remove the test blank support from the mounting flange and remove the blank. Turn the stand mounting plate to the horizontal position.

H. Assemble Insulation Blankets (Ref.Fig.513).

NOTE: This paragraph applies only if engine incorporates SB.72-20.

- (1) Assemble the insulation blanket (72-52-03/1A-32) to the socket in the right-hand insulation blanket (72-52-03/50-B) to cover the nut end of the LP shaft signal actuating arm. Wire-lock the two blankets together at the two eyelet positions.
- (2) Assemble the insulation blankets (72-52-03/1A-36 and 38) over the forward flange of the rear cover, and wire-lock at the four eyelet positions.

#### 4. Assemble Items to the Turbine Exhaust Diffuser

##### A. Install LP Shaft Signal System Rear Cable, Rear Block and Support Bracket (Ref. Fig.514).

- (1) Immerse the rear cable (76-21-02/1-150B) in lubricant T, allow to soak, then drip dry.
- (2) Apply a thin film of jointing compound A to both surfaces of the gasket (76-21-02/1-55B).
- (3) Assemble the gasket, followed by the rear mounting bracket (76-21-02/1-45) over the shoulder pins and bolts protruding from the exhaust diffuser outer case at vane No.6.
- (4) Retain the bracket and gasket with five nuts (72-53-00/4-200) with lubricant 'C' applied. Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (5) Feed the rear cable through the large hole in the rear of the bracket then connect the cable end to the actuator arm shaft with the shoulder pin, flat washer and split pin (76-21-02/1-140, 130, 120). Bend the split pin legs.
- (6) Assemble the split guide bush.
  - (a) Pre-SB.0L.593-76-9043-72. Assemble the split guide bush (76-21-01/2-580) to its location in the rear bracket.
  - (b) SB.0L.593-76-9043-72. Ensure the locating pin is installed in the rear bracket and assemble the split guide bush (76-21-01/2-580B) to its location in the rear bracket. Install the retaining plate (76-21-02/1-56A) and the attachment bolt.
- (7) Apply lubricant G liberally by brush to the length of rear cable where it is in contact with the rear block and guide bush.
- (8) Temporarily assemble the rear block (76-21-01/2-570) to the right-hand side (looking forward) of the rear support bracket and retain it with two nuts and bolts (76-21-02/1-20, 30B) with lubricant B applied. Lightly tighten the nuts.

- B. Assemble Blanking Covers and Plugs to the Inner and Outer Cases (Ref.Fig.515).

NOTE: Para.B. is only applicable to engines to pre SB.72-31 standard.

- (1) Position a gasket (4-130) and an internal plate on the inside face of the outer case surrounding the aperture between vanes No.6 and 7 ensuring that the bolt locking spigots of the plate are facing away from the case. Apply lubricant 'C' to the four bolts (4-110), and insert the bolts through the plate, assemble a gasket (4-130) and external boss to the bolts on the outside of the case, with the boss spigot facing away from the case, then assemble a keywasher (4-90) and plain nut (4-80) to each bolt.
- (2) Assemble an internal plate and gasket (4-130) to the inside of the case, and a gasket (4-130) and external boss to the outside of the case at the aperture between vanes No.4 and 5, and secure with four bolts (4-100), keywashers (4-90) and plain nuts (4-80).
- (3) Assemble an internal plate and external boss to each of the remaining three apertures and secure with bolts (4-100), keywashers (4-90) and plain nuts (4-80).

MK.610-14-28  
OVERHAUL

sneema

- (4) Torque-tighten the four plain nuts securing each plate to 100 lbf in. (11,5 N.m), then lock the nuts with the tabwashers.
- (5) Assemble a blanking cover (4-70) to each of the five external bosses, so that they locate in the boss spigots and on the bolts, then screw a locknut (4-50 or 4-60) on to each of the bolts. Torque-tighten the nuts to 100 lbf in. (11,5 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).
- (6) Lubricate the five blanking plugs (9-30) with lubricant 'B', then offer a plug into one of the holes in the inner case. From inside the case, assemble a flat washer (9-20) and nut (9-10) to the plug, then torque-tighten the plug between 60 and 65 lbf in. (6,8 and 7,3 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m). Assemble the remaining four blanking plugs to the inner case in the same manner.

C. Assemble the Spherical Joint Flange to the Outer Case.

NOTE: The spherical joint flange and attachment items are under 72-54-01 and the I.P.C. references in this paragraph are from 72-54-01.

- (1) Ensure that the fuel drain pipe (plate) (6-10) is assembled to the rear bottom position of the spherical joint flange, and is secured to a bracket on the flange with a bolt (6-20) and washer (6-30), and that the bolt is wire-locked to a hole in the plate.
- (2) Raise the spherical joint flange either by hand or using a hoist and the lifting fixture (Tool 1965) bolted onto the bracket support and the opposite blanking positions (Ref.Fig.517). Align the locating pin hole in the front face of the spherical joint flange with the locating pin in the outer case rear flange (at the normal top position), then, with the mounting plate horizontal, assemble the joint flange to the outer case, engaging the locating pin in the joint flange with the locating pin hole and aligning the bolt holes using the set of four locating pins (Tool 700).

SUB-ASSEMBLY

## 72-53-00

PRINTED IN ENGLAND

- (4) Torque-tighten the four plain nuts securing each plate between 100 and 110 lbf in. (11,3 and 12,4 N.m), then lock the nuts with the tabwashers.
- (5) Assemble a blanking cover (4-70) to each of the five external bosses, so that they locate in the boss spigots and on the bolts, then screw a locknut (4-50 or 4-60) on to each of the bolts. Torque-tighten the nuts between 25 and 30 lbf in. (2,8 and 3,4 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).
- (6) Lubricate the five blanking plugs (9-30) with lubricant 'B', then offer a plug into one of the holes in the inner case. From inside the case, assemble a flat washer (9-20) and nut (9-10) to the plug, then torque-tighten the plug between 60 and 65 lbf in. (6,8 and 7,3 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m). Assemble the remaining four blanking plugs to the inner case in the same manner.

D. Assemble the Spherical Joint Flange to the Outer Case.

NOTE: The spherical joint flange and attachment items are under 72-54-01 and the I.P.C. references in this paragraph are from 72-54-01.

- (1) Ensure that the fuel drain pipe (plate) (6-10) is assembled to the rear bottom position of the spherical joint flange, and is secured to a bracket on the flange with a bolt (6-20) and washer (6-30), and that the bolt is wire-locked to a hole in the plate.

- (3) Referring to Fig.516 for the position of the various brackets, nuts and bolts, apply lubricant 'A' to the bolts, then assemble the brackets and bolts to their correct position and screw a nut on to each bolt. Check that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m).

5. Assemble Items to the Spherical Joint Flange (Ref.Fig.517).

NOTE: The PNC pitot and the thermocouple are assembled in the positions quoted in the following text unless the nacelle position to which the engine is to be fitted is known, and requires their reversal.

NOTE: If blanks are assembled to the apertures in the joint flange, remove the blanks as required prior to assembling the items.

- A. Assemble the Pneumatic Nozzle Control Signal Pitot and Reheat Pressure Detector Connector.

NOTE: The removal and installation of the PNC pitot and reheat pressure detector connector is also detailed in 76-13-03 and the IPC references in this para. are from 76-13-03.

- (1) Assemble the spring compressor (Tool 1963) with its thumbnut unscrewed through the pitot union (1-20) from the threaded side, through the spring (1-70) and screw it into the spring plate from the spring spigot side. Tighten the thumbnut to compress the spring. Invert the union, then assemble a filter disc (1-60), restrictor (1-40) and another filter disc on top of the plate. With a retaining ring in the tapered guide (Tool 1968) place the guide over the union, and supporting the union on its flanges, tap the retaining ring into its groove using punch (Tool 1967). Remove the spring compressor by unscrewing the thumbnut to release the spring tension, then unscrew the centre screw from the spring plate.

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

snecma

- (2) If the stepped pin (1-90) is not assembled to the pitot, place the pin in Cardice for approx. 20 min, or liquid nitrogen for 2 to 3 min, then remove the pin from the cooling agent and assemble to the hole in the pitot flange at the pitot side.
- (3) Apply lubricant 'C' to new bolts (1-10 or 1-100). Insert the pitot into the aperture in the spherical joint flange between No.8 and 9 vane and locate the stepped pin in the pitot flange in the hole in the joint flange.
- (4) Position the pitot union on top of the pitot, then insert the two new bolts (1-10 or 1-100) into the pitot and screw them into the joint flange. Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts together.
- (5) Assemble the reheat pressure detector connector (1-110) to the aperture between No.2 and 3 vane and secure with two bolts (1-100). Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts together.

#### B. Assemble Jet Pipe Thermocouple Blanking Covers.

NOTE: The jet pipe thermocouple blanking covers are under the breakdown 77-21-02 and the IPC references in this para. are from 77-21-02.

- (1) Apply lubricant 'C' to the 16 bolts (2-10, 60, 30). Assemble the blanking cover (2-20) to the aperture in the spherical joint flange in line with No.3 vane, and secure with the bolts (2-10).
- (2) Assemble the bracket support (2-70) to the aperture in the spherical joint flange in line with No.8 vane with the three holes aligned fore and aft and secure with the bolts (2-60).

NOTE: The bracket support (2-70) and the blanking cover (2-20) may be interchanged depending on nacelle installation.

sneema

- (3) Assemble a gasket (2-50) and blanking cover (2-40) to the aperture in the spherical joint flange just below No.4 and 7 vanes and secure each cover with bolts (2-30).
- (4) Ensure that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the cover and bracket support bolts to 100 lbf in. (11,5 N.m).

C. Assemble the Flanged Connection.

NOTE: The flanged connection is under the breakdown 75-03-02 and the IPC references in this para. are from 75-03-02.

- (1) Apply lubricant 'C' to the five bolts (1-450 and 1-460). Assemble the flange connection (1-480) to the bottom aperture in the spherical joint flange, then insert the three bolts (1-450) into the lower (front) holes in the connection and screw them into the joint flange. Position the bracket (1-470) on the rear of the connection, then insert the two bolts (1-460) through the bracket and connection and screw them into the joint flange.
- (2) Torque-tighten the bolts to 210 lbf in. (24,0 N.m), then wire-lock the bracket bolts together, and the remaining three bolts together.
- (3) Ensure that rubber blanks (72-54-01/6-140 or 230) are assembled to the five apertures in the spherical joint flange below the horizontal centre line.

D. Assemble the Engine Power Pitots.

NOTE: The EP pitots are under the breakdown 77-12-03 and the IPC references in this para. are from 77-12-03.

- (1) Assemble a gasket (1-240) to each of the four pitots, then assemble the pitots to the apertures in the spherical joint flange between No.7 and 8, and No.3 and 4 vanes, and in line with No.5 and 6 vanes, with the unions of the pitots facing downwards (forward).

# OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- (2) Apply lubricant 'C' to bolts (1-220 and 1-225). On engines to pre-SB.77-3 standard, position a bracket (1-230) on top of the pitots at No.5 and 6 vanes so that the brackets extend upwards, then insert bolts (1-220) through the brackets, pitots and gaskets and screw them into the joint flange. With the heat shield support bracket (71-32-02/5-110) positioned on the pitot located between No.3 and 4 vanes, secure the remaining two pitots with bolts (1-220 and 1-225). On engines to SB.77-3 standard, position the heat shield support bracket (71-32-02/5-110) on the pitot located between No.3 and 4 vanes, then secure the four pitots with bolts (1-220B and 1-225). Torque-tighten all the bolts to 100 lbf in. (11,5 N.m) and wire-lock each pair of bolts. Apply lubricant 'A' to the threads of the four pitot unions.

NOTE: The heat shield support bracket (71-32-02/5-110) may be transferred to the pitot located between No.7 and 8 vanes, to suit the nacelle installation.

- (3) Position the tube assembly (1-180) around the joint flange, and screw the tube union nuts onto the four pitots. Torque-tighten the union nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m), then wire-lock the nuts to the pitot bolts.
- (4) Apply lubricant 'A' to bolts (1-160) then insert a bolt through the (integral) bracket at one end of the tube and the bracket bolted to the spherical joint flange and screw a nut (1-55) onto the bolt. Assemble a bolt (1-160) and nut (1-155) to the brackets at the other end of the tube. Ensure that the minimum locking (run-down) torque is 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m). If a closure nut (1-70) is not assembled to each end of tube, lubricate the nuts with lubricant 'A', then screw a nut onto each end of the tube. Torque-tighten the nuts between 220 and 240 lbf in. (24,9 and 27,1 N.m).
- (5) Assemble to the tube in line with No.7 vane, the bush assembly (1-80), and the inner and outer clamps (1-60 and 1-70). Lubricate the bolts (1-30), or bolt (1-30) and bolt (1-40) (SB.77-7) with lubricant 'A', then insert bolt (1-30) or bolt (1-40) (SB.77-7) through the clamps and bracket at bolt positions 66 and 67 of the diffuser rear flange, and assemble a

SUB-ASSEMBLY

## OVERHAUL

washer (1-50) and nut (1-20) to the bolt. Assemble another bush/clamp assembly to the tube in line with No.4 vane and bolt it to the bracket at bolt positions 42 and 43 with a bolt (1-30), washer (1-50) and nut (1-20). Torque-tighten the bolts to 100 lbf in. (11,5 N.m) ensuring that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m).

- (6) Assemble a bush assembly (1-140) and the inner and outer clamps (1-120 and 1-130) to the tube at the bottom position. On engines to pre-SB.77-3 standard apply lubricant 'A' to the pillar bolt (1-110), then assemble it into the right-hand hole in the top face of the bracket at the bottom position of the spherical joint flange. Locate the clamps on the pillar bolt then screw the nut (1-100) onto the bolt. On engines to SB.77-3 standard, apply lubricant 'A' to the bolt (1-110B), then insert the bolt through the clamps, the right-hand hole of the bracket, and into the nut (1-100). Ensure that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nut to 100 lbf in. (11,5 N.m).
- (7) Assemble the bolt (71-32-02/4-110) and nut (71-32-02/4-100) to the left-hand hole of the bracket (75-03-02/1-470) and temporarily tighten.
- (8) Check the complete length of the tube and ensure that no part of the tube is within 0.150 in. (3,81 mm) of any part of the spherical joint flange.
- (9) On engines to SB.77-11 standard, position the bush 1-150, outer clamp 1-148, inner clamp 1-149, over the tube between vanes 3 and 4 to align with the bracket attached to the reheat flame detector mounting flange. Apply lubricant 'A' to the bolt threads 1-142, place a washer 1-143 over the bolt and insert in the clip to bring into contact with the self locking clipnut 1-144 attached to the bracket and lightly tighten. At the position between No.7 and 8 vanes assemble bush 1-10, outer clamp 1-8, inner clamp 1-9. Apply lubricant 'A' to threads of bolt 1-3, place a washer 1-4 over the locking nut 1-5 attached to the bracket at the reheat spray ring bush and temporarily tighten.

OVERHAUL

After ensuring no part of the tube is within 0.150 in. (3,81 mm) of any part of the spherical joint flange, torque-tighten the bolts to 100 lbf in. (11,5 N.m) ensuring that the locking (Run-down) torque is not less than 3.5 lbf in. (0,4 N.m.).

6. Assemble the Heat Shields to the Assembly

- A. Assemble Heat Shield Mounting Brackets to the Containment Shield (Ref.Fig.518).

NOTE: The heat shields are under the breakdown 71-32-02 and the IPC references in this para. are from 71-32-02.

- (1) Apply lubricant 'B' to the attachment bolts (3-20 and 3-80) of the heat shield bottom (front) brackets. Examine the front brackets (3-10) for a small right-angled plate riveted to the end of the bracket. If the angled plate is not attached, a locating distance piece (3-30) must be used with each bracket. Assemble the 10 brackets (in turn), to the rear (top) end of the containment shield (Ref.Fig.518, detail A and C) as follows:
- (a) Position the bracket (3-70) on the shield (at approx. No.9 vane location) and locate the plate on the end of the shield, then insert the bolt (3-80) and screw it into the shield. Torque-tighten the bolt between 60 and 65 lbf in. (6,8 and 7,3 N.m), then wire-lock the bolt to the hole in the bracket.
  - (b) If distance pieces are to be used, insert a bolt (3-20) through the bracket and distance piece so that the locking hole is adjacent to the bolt head, and the anchor nut boss protrudes outwards through the bracket and screw the bolt into the shield. Torque-tighten the bolt between 60 and 65 lbf in. (6,8 and 7,3 N.m), then wire-lock the bolt to the hole in the distance piece. Assemble the remaining eight brackets in the same manner.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) If the plate is riveted to the bracket, insert a bolt into the bracket with the locking hole adjacent to the bolt head and screw the bolt into the shield. Torque-tighten the bolt between 60 and 65 lbf in. (6,8 and 7,3 N.m), then wire-lock the bolt to the hole in the plate tag. Assemble the remaining eight brackets in the same manner.

B. Assemble Heat Shield Mounting Brackets to the Spherical Joint Flange (Ref.Fig.518).

NOTE: The heat shields are under the breakdown 71-32-02 and the IPC references in this para. are from 71-32-02.

- (1) Apply lubricant 'B' to the attachment bolts (3-140, 190, 240, 290, 340, 390 and 440) of the heat shield top (rear) brackets. Position a bracket (3-270) under the bracket riveted to the spherical joint flange at the (normal) top position, so that the bracket extends upwards (rearwards). Insert two bolts (3-290) through the brackets and screw nuts (3-280) onto them. Assemble the remaining brackets (3-270 (2 off) and 3-370 (1 off)) to their positions at (approx.) vane 2, 5 and 6 and secure with bolts (3-290 (4 off) and 3-390 (2 off)) and nuts (3-280 (4 off) and 3-380 (2 off)). Ensure that the locking (run-down) torque is not less than 2.0 lbf in. (0,23 N.m), then torque-tighten the nuts between 28 and 32 lbf in. (3,16 and 3,62 N.m).
- (2) Position brackets (3-170 and 420) under the brackets riveted to the joint flange at (approx.) vane 1 and 10 position, so that the brackets extend downwards (forwards). Insert two bolts (3-190 and 440) through each of the brackets and screw nuts (3-180 and 430) onto them. Ensure that the locking (run-down) torque is not less than 2.0 lbf in. (0,23 N.m), then torque-tighten the nuts of the two brackets between 28 and 32 lbf in. (3,16 and 3,62 N.m).

SUB-ASSEMBLY

72-53-00

Page 556

Aug 1/81

MK.610-14-28

OVERHAUL

- (3) Position the brackets (3-320 and 120) under the brackets riveted to the joint flange at (approx.) vane 3 or 7 position, so that the brackets extend upwards. Insert two bolts (3-340 and 140) through each bracket and screw nuts (3-330 and 130) onto them. Ensure that the locking (run-down) torque is not less than 2.0 lbf in. (0,23 N.m), then torque-tighten the nuts between 28 and 32 lbf in. (3,16 and 3,62 N.m).
- (4) Position the bracket (3-220) under the bracket riveted to the joint flange at (approx.) vane 8 position, so that the bracket extends downward. Insert two bolts (3-240) through the brackets and screw nuts (3-230) onto them. Ensure that the locking (run-down) torque is not less than 2.0 lbf in. (0,23 N.m), then torque-tighten the nuts between 28 and 32 lbf in. (3,16 and 3,62 N.m).

NOTE: The remaining heat shield brackets will have been assembled during assembly of the spherical joint flange (Ref. para. 4.D.).

- C. Assemble the Heat Shields to the Outer Case, Containment Shield and Spherical Flanged Joint (Ref. Fig. 519).

NOTE: The engine heat shields are under breakdown 71-32-02 and the IPC references in this para. are from 71-32-02.

- (1) Apply lubricant 'G' to the inside faces of each panel to cover the area of overlap of the panels when assembled to each other. Apply lubricant 'B' to the heat shield attachment bolts.

NOTE: Although not essential it is recommended that the heat shields are assembled in sequence starting with the panel joint near No. 1 vane.

SUB-ASSEMBLY

72-53-00

Page 557

Aug 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Slot No.1 panel into No.2 panel, then locate the joint mounting holes over the bosses of the front and rear brackets near to vane No.1. Ease the top (rear) mounting hole clear of the boss, feed a knitmesh damper (2-250) onto the boss, then a thin washer (2-240) with its cupped side towards the damper and press the panels back onto the boss. Assemble a thin washer, cupped side out, and a damper onto the boss, then, with a flat washer (2-220) assembled to the bolt (2-210), screw the bolt into the boss ensuring that the thin washer and damper do not prevent the flat washer being clamped onto the boss. Secure the bottom (front) point of the No.1/2 panel joint using the same procedure as the top (rear) attachment, and components itemised in Table 503.

NOTE: If difficulty is found in locating the panels on the bracket bosses, (which is more likely to be apparent when several panels are assembled), it may be due to the containment shield being incorrectly positioned, requiring it to be turned. To turn the containment shield, the support brackets (Tool 297) will have to be removed.

- (3) Ease the No.2 panel off the bracket bosses, then slide the No.3 panel onto No.2 panel ensuring that No.2 panel engages in the overlap and the holes align. Bolt the panel 3/2 joint to its front and rear brackets following the procedure of para.2, and the components of Table 503.
- (4) Continue to assemble in sequence, noting the following special features.
- (a) For the three positions shown in Fig.519 a (strengthening) flat washer (Ref.Table 503) is assembled to the bracket boss before the first knitmesh damper and thin washer.
  - (b) At the rear position of panel 7, a bracket (1-265) is assembled under the bolthead in place of a flat washer and positioned with its open end towards the (normal) bottom of the engine.

\*Bracket (Ref. para. (4), (b)).      +Bracket (Ref. para. (4), (c)).

## I.P.C. Ref. No. of Heat Shield Attaching Parts Table 503

- (c) At the rear and central positions of panel 5/4 a channel assembly (2-75) is mounted under the boltheads in place of the flat washers, positioned with the channel towards the engine (normal) bottom.
- (d) At the rear of panel 6/5 a pillar bolt (1-285) is installed in place of a normal bolt.

SUB-ASSEMBLY

- (5) Ensure that the locking (run-down) torque on each of the bolts is not less than 3.5 lbf in. (0,4 N.m) and that they are torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Assemble bolt (1-330) onto the pillar bolt and temporarily tighten.
- (6) Remove the four slave brackets from the containment shield by releasing the eight mounting bolts then pulling the brackets radially outwards to release them from their locating pins.

7. Assemble Remaining Items to the Turbine Exhaust Diffuser

- A. Assemble the Air Supply and Vent Elbows (Ref.Fig.505 and 507).

NOTE: The elbows and brackets will be released and/or removed during final engine build for the assembly of the air tubes, and are only temporarily assembled at this stage.

- (1) Release and remove the four (slave) nuts securing the outer end of the cooling air feed duct at the No.2 vane. Assemble the elbow (1-50) to the protruding bolts, then assemble the bracket (1-40) to the front two bolts on the right-hand side. Screw six nuts (1-10) onto the bolts and tighten the nuts.
- (2) Release and remove the four (slave) nuts securing the outer end of the hot air vent duct at No.4 vane. Assemble the elbow (1-220) to the protruding bolts, then assemble a bracket (1-210) to the two rear upper (normal attitude) bolts, and bracket (1-200) to the two rear lower (normal attitude) bolts. Screw six nuts (1-170) onto the bolts and tighten the nuts.
- (3) Release and remove the four (slave) nuts securing the outer end of the hot air vent duct at No.7 vane. Assemble the elbow (2-120) to the protruding bolts, then assemble a bracket (2-110) to the two rear bolts, and bracket (2-115) to the two lower (normal attitude) bolts. Screw six nuts (2-80) onto the bolts with lubricant 'C' applied to the threads. Torque-tighten the nuts (2-80) to 100 lbf in. (11,5 N.m).

OVERHAUL

- B. Assemble the Fuel Drain Assembly and Attach it to the Outer Case (Ref.Fig.520 or 521).

NOTE: The fuel drain assembly is under breakdown 71-73-06 and the IPC references in this para. are from 71-73-06.

There are two alternative procedures for assembling the drain valve to the outer case. The procedure is dependant on whether an internal boss or a saddle plate assembly is used at the drains block mounting location on the outer case.

- (1) Place the two washers (1-120) in a container with Cardice for (approx.) 20 min. or liquid nitrogen for (approx.) 2 to 3 min. Remove the washers from the Cardice or nitrogen container, then assemble one of the washers to its seating in the lower drain body, and the remaining washer to its seating in the upper drain body.
- (2) Holding the lower drain body with its apertures uppermost, rest a spring on the assembled washer, then rest a valve on top of the spring. Position a valve in the remaining orifice, then rest a spring on top of the valve. Lower the upper drain body over the valve and spring, ensuring that the spring is correctly positioned on the washer in the upper drain body. Apply lubricant 'C' to two bolts (1-30) and nuts (1-20). Compress the springs and abut the upper and lower bodies, then insert the bolts through the flange of the lower body and into the upper body flange and secure with the nuts. Ensure that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (3) On engines with internal boss (Ref.Fig.520).
  - (a) Apply lubricant 'C' to the four bolts (1-10).
  - (b) Position the gasket (1-150) on the upper drain body, then position the gasket/drain assembly on its mounting face at the bottom of the outer case, and secure with the four bolts.
  - (c) On engines to SB.71-8494-27 standard, install a wire locking plate (1-65) under the head of the left-hand forward bolt (1-10).

- (d) Torque-tighten the bolts to 100 lbf in. (11,5 N.m), then wire-lock the bolts at each side of the valve together in pairs.
- (e) Examine the inside of the outer case and ensure that the bolts do not protrude above the surface of the case.
- (4) On engines with saddle plate assembly (Ref.Fig.521).
- (a) Position the inner saddle piece (1A-170) on the inner surface of the outer case.
- (b) Apply lubricant 'C' to the four bolts (1A-160) and install the four bolts from the inside of the outer case.
- (c) Position the gasket (1A-150) and the outer saddle piece (1A-180) on the four bolts. Install four retaining rings (1A-190) over the four bolts.
- (d) Position the gasket (1A-150)/drain assembly on the four bolts and secure with four nuts (1A-200). On engines to SB.71-8494-27 standard, install a wire locking plate (1A-65) under the forward left hand nut.
- (e) Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (5) Apply lubricant 'C' to the three eccentric headed bolts (1-60) and nuts (1-50). Position the sleeve either over the aperture of the lower drain body, or in the sealing plate aligning the securing holes, then position the sealing plate on the lower drain body and insert the packing piece between the body and plate at the rear securing hole. Insert the three eccentric headed bolts into the sealing plate locating the heads in the plate, and secure with the nuts. Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nuts to 135 lbf in. (15,2 N.m). Ensure that the heads of the bolts are 0.005 to 0.015 in. (0,127 to 0,381 mm) below the surface of the sealing plate.

sneema

- (6) Apply lubricant 'C' to the plug (1-110), then screw the plug into the front of the lower drain body. Torque-tighten the plug to 100 lbf in. (11,5 N.m).
- (7) On engines to pre-SB.71-8494-27 standard, wire-lock the plug to the lower drain body.
- (8) On engines to SB.71-8494-27 standard, wire-lock the plug to the wire-locking plate (1-65).
- (9) Assemble the cover blank (1-250) or protector (Tool 961) to the sealing plate.

8. Remove the Turbine Exhaust Diffuser from the Build Stand

A. Attach the Lifting Fixture to the Diffuser (Ref.Fig.502).

- (1) Completely slacken the seven thumbnuts on the lifting fixture (Tool 1953), then turn the latches so that the pins on their heads point inwards towards 'FREE'.
- (2) Operate the build stand (if necessary) to position the diffuser with its rear face uppermost.
- (3) Lower the fixture (Tool 1953 or Tool 305 for pre-SB.72-181 standard engines only) onto the rear face of the diffuser inner case.
- (4) With fixture (Tool 1953), rotate the latches inside the inner case (outwards) to the 'LOCKED' position, then tighten the thumbnuts (Tool 1953), or with fixture (Tool 305), on pre SB.72-181 standard engines, screw the captive bolts of the fixture (Tool 305) into the caged nuts of the inner case.

B. Remove the Diffuser from the Stand.

- (1) Attach a hoist to the lifting fixture ring. Release the nuts on the mounting clamps on the mounting plate and slide the clamps clear of the flange.
- (2) Lift the diffuser clear of the stand, then lower the diffuser onto the fixture (Tool 1230) positioned on a pallet (Tool 1428), ensuring that the diffuser rests in the recesses in the uprights of the fixture.

OVERHAUL

- (3) Disconnect the hoist, then release the lifting fixture by unscrewing the captive bolts, or by releasing the thumbnuts and turning the latches inwards towards 'FREE'. Remove the fixture.
- (4) Release the six wingnuts on the clamps of the protector (Tool 437) then pull the clamps outwards. Place the protector on the rear flange of the spherical joint flange with the word 'TOP' on the protector aligned with the normal top position of the diffuser. Pull the clamps inwards to grip under the flange, then tighten the wingnuts.

## LEFT-HAND ACCESSORY GEARBOX - SUB-ASSEMBLY

### 1. General

- A. Prior to commencing assembly, refer to 72-09-00, Assembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly, and for the Manufacturers Part No. refer to the Special Tools, Fixtures and Equipment Table 1002.
- C. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them due to duplication of title e.g. nuts, bolts, washers etc. Where the item is part of this text it will be identified as e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the Item No. Where items from any other breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- D. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref. No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).
- E. The left-hand gearbox sub-assembly is basically composed of three units, gearbox case, diaphragm/gearshaft assembly and front cover. With one exception, the gearshafts are assembled to the diaphragm which locates inside the gearbox. Two bevel gear pinions are installed in the gearbox case, these engage with the diaphragm/gearshaft assembly. Oil jets are installed inside the gearbox case and front cover. The front cover and joint washer form an oil tight joint with the gearbox case. Although it is a separate sub-assembly, the main oil pump is assembled to the gearbox case and subjected to oil pressure test and functional test with the gearbox assembly.

## 2. Assemble Components to Cases for Initial Oil Flow Test

### A. Prepare for Assembly.

- (1) Ensure that all components are thoroughly clean and damage free. Particular attention must be given to the cleanliness of oilways and bores. Remove protectors from the cases only when it is necessary to do so.

### B. Assemble Components to Front Cover (Ref.Fig.501).

NOTE: The text is written to SB.72-9 Parts 1 and 2 standard and does not include the assembly of the bearing outer tracks to the front cover.

- (1) Remove the protector from the cover.
- (2) Use a suitable freezing agent, shrink the following items:
  - (a) Stepped pins (72-62-01/2-160).
  - (b) Stepped pin (72-62-01/3-320).
- (3) Assemble holding fixture (Tool 151) to the front cover and secure the assembly in the Hydraclamp (Tool 1643).
- (4) Using the driver (Tool 1524), assemble the stepped pins (72-62-01/2-160) to the quick attach/detach (QAD) coupling location, and the stepped pin (72-62-01/3-320) to the QAD bracket location. Replace the protector (Tool 146) to the QAD mounting face.
- (5) Assemble the short flanged pins (72-62-01/3-120) to position A, and long flanged pin (72-62-01/3-140) to position B on the front cover.
  - (a) Ensure the thorough cleanliness of tools. Place the mechanical puller (Tool 272) in position at a flanged pin location. Place the flanged pin in position and retain it with a nut (Tool 269). Ensure that the flanged pin is aligned correctly with the hole in the cover flange. Tighten the nut to insert the flanged pin into the cover flange. Ensure that the mechanical puller is restrained to prevent rotational movement, which could cause damage to the sealing surface of the flange.
- (6) Assemble the oil jet (72-62-01/3-470) to position C on the inner surface of the cover. Screw the jet fully into position and carefully tighten it.
- (7) Assemble the plug (72-62-01/3-350) to position D (Ref. Fig.501) on the inner surface of the cover. Screw the plug fully into position and carefully tighten it.

- (8) Assemble the oil jet (72-62-01/3-490) to position E on the angled section of the cover. Apply lubricant 'A' to securing bolts (72-62-01/3-480). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the jet with the bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (9) Assemble the connector (72-62-01/3-380) to the filter (72-62-01/3-390), then insert the assembly into the inner surface of the cover at position F.
- (a) Insert the assembly into the bore on the inner surface of the cover at the small end. Secure the filter assembly to the cover with retaining cap (72-62-01/3-370). Assemble the driver (Tool 1484) to the cap and press the cap into position.
- (b) Apply lubricant 'A' to the retaining bolt (72-62-01/3-360). Ensure that the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the cap with the bolt torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (10) On engines to Pre-SB.72-12 assemble the oil jet (72-62-01/3-450A) to filter assembly (72-62-01/3-460A) and secure the assembly to the bore in the front cover with the retaining cap (72-62-01/3-440A) and bolt (72-62-01/3-420A).
- (a) Place the filter in the vice holder (Tool 159) and ensure that the slot in the end of the filter engages with the pin in the bore of the tool. Screw the oil jet into the end of the filter and carefully tighten it with the turning key (Tool 1485).
- (b) Remove the assembly and insert it filter first into the bore in the front cover at position G.
- (c) Assemble driver (Tool 1484) to the retaining cap and press the cap in position over the filter assembly.

OVERHAUL

- (d) Apply lubricant 'A' to the retaining bolt and secure the cap to the cover. Ensure that the bolt has a locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (11) On engines to SB.72-12 assemble the oil jet sealing plug (72-62-01/3-450B) to the filter assembly (72-62-01/3-460) and secure the assembly to the bore in the front cover with the bolt (72-62-01/3-420B) and flat washer (72-62-01/3-430A).
- (a) Place the filter in the vice holder (Tool 159) and ensure that the slot in the end of the filter engages with the pin in the bore of the tool.
- (b) Screw the oil jet sealing plug into the end of the filter and carefully tighten it with the turning key (Tool 1485).
- (c) Assemble driver (Tool 1484) to the sealing plug and carefully press the assembly into the bore in the front cover at position G (Ref.Fig.501).
- (d) Apply lubricant 'A' to the retaining bolt and secure the sealing plug to the cover with the bolt and flat washer. Ensure that the retaining bolt has a locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(12) Assemble the protectors (Tool 146 and 140) to the cover.

C. Assemble Components to Gearbox Case.

- (1) Remove the protectors from the gearbox case.
- (2) Use a suitable freezing agent, shrink the following items:
- (a) Hollow pins (72-62-01/5-180A) Pre-SB.72-18 or (72-62-01/5-180B) SB.72-18.
- (b) Stepped pins (72-62-01/6-160).
- (3) Place the case on a suitable surface which will not cause damage to the machined surfaces of the cover.

NOTE: Stepped pins and hollow pins are assembled to opposite surfaces of the case. When turning the case in the following procedures the projection of pins must be considered.

MK.610-14-28

OVERHAUL

- (4) Use driver (Tool 1524) to assemble the stepped pins to the QAD coupling location on the rear of the case (Ref.Fig.502).
- (5) Assemble the following items to the cover location flange on the front of the case (Ref.Fig.502).
- (a) Assemble the hollow pin (72-62-01/5-180) to position A. Use driver (Tool 153) to assemble the pin.
  - (b) On engines to Pre-SB.72-32 insert the oil strainer assembly (72-62-01/5-10A) into the gearbox case. The open end of the strainer must locate in the bottom of the bore at position B. Ensure that the strainer is fully in position, then assemble the hollow pin (72-62-01/5-180) to the bore to retain the strainer assembly. Use driver (Tool 153) to assemble the pin.
  - (c) On engines to SB.72-32 screw the oil jet (72-62-01/5-20) into the oil strainer assembly (72-62-01/5-10B) and insert the assembly into the gearbox using puller (Tool 156) if required. The oil jet must locate in the bottom of the bore at position B. Ensure that the assembly is fully in position, then using driver (Tool 153) assemble the hollow pin into the bore to retain the strainer assembly.
- (6) Prepare the assembly stand (Tool 875) to accept the gearbox case (Ref.Fig.503).
- (a) Unscrew the locking pin attached to the vertical support and rotate the gearbox mounting adapter until it is in the vertical position. Screw the locking pin into position to lock the adapter.
  - (b) Assemble the main drive location adapter (Tool 867) to the gearbox mounting adapter and secure it with nuts.
  - (c) Assemble the pressure test adapter (Tool 868) to the adjustable angled bracket on the mounting adapter and secure it with the nut.
- NOTE: The angled bracket may be loosened to assist alignment when the gearbox is installed in the assembly stand.
- (7) Transfer the gearbox case to the assembly stand (Ref.Fig.503).
- (a) Remove the protector (Tool 146), then assemble the lifting fixture (Tool 313) to the gearbox case and secure it with captive bolts.

SUB-ASSEMBLY

72-62-00

Page 507

Nov 1/78

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (b) Attach a crane hoist to the lifting fixture and transfer the assembly to the build stand.
  - (c) Align the gearbox with the mounting locations on the build stand mounting adapter, then secure the gearbox with the assembly stand bolts.
  - (d) Ensure that the angled bracket and pressure test adapter are in position and secure.
- (8) Remove the lifting fixture from the gearbox and re-assemble the protector (Tool 146).
- (9) Install the oil jet and oil strainer (Ref.Fig.503).

CAUTION: END OF STRAINER PROTRUDES FROM BORE WHEN FULLY INSERTED. EXERCISE CARE TO PREVENT FILTER COLLAPSING DURING INSERTION.

- (a) Screw the oil jet (72-62-01/5-90A) Pre-SB.72-12 or oil jet (72-62-01/5-90B) SB.72-12 into the oil strainer (72-62-01/5-80).
  - (b) Insert the assembly into the gearbox case so that the oil jet locates in the bottom of the bore.
  - (c) Assemble the driver (Tool 1481) to the end of the oil strainer and carefully press the assembly into position.
  - (d) Secure the oil jet strainer assembly with a gasket (72-62-01/5-70) SB.72-15, end plate (72-62-01/5-60) bracket (72-62-01/5-50) and bolts (72-62-01/5-40).
  - (e) Apply lubricant 'A' to the bolts, ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Place the components in position, then torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (10) Assemble the oil jet (72-62-01/5-110) to the QAD coupling position (Ref.Fig.503).
- (a) Apply lubricant 'A' to the securing items.
  - (b) Place the oil jet in position and secure it with a bolt (72-62-01/5-100). Ensure that the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SNECMA

(11) Assemble the end plate (72-62-01/7-270) (Ref.Fig.503).

- (a) Apply lubricant 'A' to the bolts (72-62-01/7-260) and ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (b) Assemble the gasket (72-62-01/7-280) SB.72-15 end plate and bolts to the case. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(12) Assemble the oil jet (72-62-01/5-30) to the inner surface of the case (Ref.Fig.504 position A). Screw the jet fully into position and carefully tighten it.

(13) Assemble the bolts (72-62-01/4-340) and load spreading blocks (72-62-01/4-350) to position B (Ref.Fig.504), then secure the bolts with retaining rings (72-62-01/4-330). Use guide sleeve (Tool 271) and driver (Tool 1959) to assemble the retaining rings.

(14) Assemble the bolt (72-62-01/4-90) and load spreading washer (72-62-01/4-80) to position C (Ref.Fig.504), then secure the bolt with a retaining ring (72-62-01/4-70).

(15) On engines Post SB.72-7510-166 standard, assemble the integral bearing (72-62-02/1A-260B) SB.72-7510-166, or (72-62-02/1A-260C) SB.72-8651-246, or ball and roller bearing assembly (72-62-02/1B-140A or B) SB.72-8990-383 and oil jet (72-62-02/1-230) to the main drive position (Ref.Fig.504).

**NOTE:** Protective material must be removed from the bearing before assembly. The bearing must also be lubricated (Ref.72-09-00, Assembly).

- (a) Apply lubricant 'A' to the bolts. Ensure thorough cleanliness of all components and the main drive location.

SUB-ASSEMBLY

**72-62-00**

OVERHAUL

- (b) Remove the parallel roller assembly from the integral bearing, identify it for later reference and place it in a container.
- (c) Place the integral bearing in the main drive shaft bore inserting it from the inside of the gearbox case.
- (d) Support the bearing and place the oil jet (72-62-02/1-230) on to the outer side of the main drive bore. Ensure that the oil jet spigot locates in the oil feed hole.
- (e) Continue to support the bearing. Position the lubricating nozzle (72-62-02/1A-250B) SB.72-7510-166, or (72-62-02/1A-250C) SB.72-32 inside the gearbox and align it with the previously installed oil jet. Insert two bolts (72-62-02/1A-240) through the inner jet to secure both oil jet and lubricating nozzle, then temporarily retain the assembly with two nuts (72-62-02/1A-210).
- (f) Insert the three bolts (72-62-02/1A-240) through the remaining bearing locations. Secure each bolt with a load spreading plate (72-62-02/1A-220) and nut (72-62-02/1A-210) positioned on the outer side of the main drive bore.

OVERHAUL

- (g) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the oil jet nuts and bearing nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**NOTE:** To prevent bearing outer track distortion, it is desirable that a clearance exists between the flat of the bolt dee head and the adjacent edge of the bearing outer race, particularly at the lubricating nozzle location, on completion of the torque tightening procedure.

To achieve this, a feeler or some similar device may be temporarily inserted into the bolt dee head gap during torque tightening, and removed on completion.

- (16) On engines to Pre SB.72-7510-166 assemble the ball bearing assembly (72-62-02/1-260A) parallel roller bearing journal (72-62-02/1-360A) and oil jets to the main drive position.

**NOTE:** Protective material must be removed from the bearing before assembly. The bearing must also be lubricated (Ref.72-09-00, Assembly).

- (a) Apply Lubricant 'A' to securing items.
- (b) Place the oil jet (72-62-02/1-230) on to the outer side of the main drive bore. Ensure that the oil jet spigot locates in the oil feed hole (Ref.Fig.504).
- (c) Position the oil jet (72-62-02/1-250A) inside the gearbox and align it with the previously installed oil jet. Insert two bolts (72-62-02/1-240) through the inner jet to secure both jets. Retain the bolts with nuts (72-62-02/1-210).
- (d) Place the ball bearing journal (72-62-02/1-260A) on the outer side of the main bore, ensure that it locates correctly into the bore.

- (e) Remove the inner track from the parallel bearing journal (72-62-02/1-360) identify the track and place it in a protective container. Place the roller assembly on the inner side of the main drive bore.
- (f) Align the bolt-holes in both bearing assemblies then insert the retaining bolts (72-62-02/1-240) through the inner bearing and secure the assemblies with nuts (72-62-02/1-210).
- (g) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bearing and oil jet nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

### 3. Temporarily Assemble Cases Together

#### A. Assemble Diaphragm to Gearbox Case (Ref.Fig.505).

- (1) Ensure thorough cleanliness of components.
- (2) Place the diaphragm in the gearbox case. Assemble three flanged pins (72-62-01/4-20-40) to the diaphragm. Temporarily retain the pin at position A (Ref.Fig.505) with a bolt (72-62-01/4-10). Secure the pins at position B with bolts (72-62-01/4-30).

#### B. Assemble Front Cover to Gearbox Case (Ref.Fig.505).

- (1) Ensure thorough cleanliness of the cover especially oilways. Apply lubricant 'A' to securing items.
- (2) Place the cover in position over the diaphragm and gearbox case, ensuring that the pins locate correctly in the gearbox flange.
- (3) Temporarily secure the cover with the following items.
  - (a) At the previously installed pin locations at position C with bolts (72-62-01/3-110) and at position D with bolt (72-62-01/3-130).
  - (b) At position E with load spreading washers (72-62-01/3-80) and bolts (72-62-01/3-70).
  - (c) At position F with load spreading washers (72-62-01/3-100) and bolts (72-62-01/3-90).
  - (d) At the remaining bolt locations with load spreading washers (72-62-01/3-60) and bolts (72-62-01/3-50).

#### 4. Oil Flow Check

A. Prepare for Flow Check (Ref.Fig.506 and Fig.507).

**NOTE:** For details of mobile pressure test rig (Tool 1926) refer to the manufacturers information. Oil specification lubricant 'A'.

- (1) Ensure thorough cleanliness of blanks, adapters and equipment.
- (2) Assemble pressure test adapter (Tool 704) to the cover unit. This adapter is stored in container (Tool 799).
- (3) Assemble the pressure test adapter (Tool 149) to the transfer tube location on the oil pump face of the casing.
  - (a) Ensure that the ring seal on the bobbin is in good condition, then insert the bobbin in the case.
  - (b) Assemble the joint washer and plate over the bobbin, and secure the assembly to the tube location flange with nuts and washers.
- (4) Assemble the pressure test blank (Tool 150) to the gearbox case and secure it with six bolts and washers. This blank is stored in container (Tool 799).
- (5) Connect the oil pressure test rig (Tool 583) to the gearbox case assembly.
  - (a) Connect the oil feed hose to the pressure test adapter (Tool 149).
  - (b) Connect the oil scavenge hose to the pressure test adapter (Tool 704).
- (6) Ensure that an adequate amount of oil is contained in the mobile pressure test equipment. Suitable protective clothing must be worn to minimise personnel contact with oil.
- (7) Check that the oil drip tray on the assembly stand is in position and that a suitable oil drainage container is available.
- (8) Place the transparent protection cover (Tool 797) over the gearbox.

OVERHAUL

- (9) Connect the test equipment to the mains electricity supply of 30 A 600 V a.c. Ensure that the circulating pump and oil heater is switched OFF.

- (10) Open the oil return stop valve on the test equipment.

B. Oil Flow Check Procedure.

- (1) Switch ON the circulating pump motor and regulate the oil flow between 3 and 5 psi until a discharge of oil is evident from the gearbox and cover jets.
- (2) Examine each oil jet to ascertain that it is flowing oil freely.
- (3) On satisfactory completion of visual flow check, switch off the mains electricity supply and disconnect the pressure test equipment from the gearbox.
- (4) Remove the pressure test adapters and blank from the gearbox. Return the adapter (Tool 704) and blank (Tool 150) to the container (Tool 799).
- (5) Return clean drainage oil to the mobile pressure test equipment.

5. Disassemble Cases and Examine Oil Filters

A. Remove Front Cover.

- (1) Remove the bolts securing the front cover to the gearbox case at the flanged pin positions.
- (2) Remove the remaining bolts and load spreading washers from the flange. Carefully separate the joint flanges by using puller (Tool 1021). Ensure that residual oil drains into the drip tray.
- (3) Assemble the holding fixture (Tool 151) to the front cover and secure the assembly in the Hydraclamp (Tool 1643).

B. Examine Front Cover Oil Filters.

- (1) Remove the filter/connector assembly from position F (Ref.Fig.501).
  - (a) Release the bolt securing the retaining cap and withdraw the retaining cap.

OVERHAUL

- (b) Screw the puller (Tool 158) into the connector and withdraw the assembly from the bore.
  - (c) Examine the filter assembly and bore for cleanliness. Remove all deposits of foreign matter.
- (2) Assemble the filter/connector assembly.
- (a) Insert the assembly into the bore and secure it with the retaining cap and bolt.
  - (b) Apply lubricant 'A' to the bolt and ensure that it has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Remove the filter from position G (Ref.Fig.501).
- (a) Release the bolt and washer securing the retaining cap, then remove the retaining cap.
  - (b) Screw the puller (Tool 158) into the filter and withdraw the assembly from the bore.
  - (c) Examine the filter assembly and bore for cleanliness. Remove all deposits of foreign matter.
- (4) Install the filter.
- (a) Insert the filter into the bore and secure it with the retaining cap washer and bolt.
  - (b) Apply lubricant 'A' to the bolt and ensure that it has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).

C. Examine Gearbox Case Oil Filters.

- (1) Remove the diaphragm (Ref.Fig.505).
  - (a) Release the bolts, securing the diaphragm to the gearbox case. Withdraw the flanged pins from the diaphragm using the puller (Tool 177).
  - (b) Withdraw the diaphragm. Place the diaphragm in a suitable container.

SUB-ASSEMBLY

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Remove the oil strainer retained by the hollow pin on the gearbox case/cover flange (Ref.Fig.502).
  - (a) Use puller (Tool 154) with impact puller (Tool 1653) to remove the hollow pin.
  - (b) Use puller (Tool 156) with impact puller (Tool 1653) to remove the oil strainer assembly from the bore.
  - (c) Examine the oil strainer assembly and bore for cleanliness. Remove all deposits of foreign matter.
- (3) Install the oil strainer assembly.
  - (a) Shrink the hollow pin with a suitable freezing agent.
  - (b) Insert the oil strainer assembly so that the oil jet locates in the bottom of the bore. Ensure that the assembly is fully in position.
  - (c) Assemble the hollow pin to the bore to hold the assembly in position.
- (4) Disassemble the cover and bracket from the oilway near the QAD coupling location on the rear of the gearbox case. Remove the oil jet and strainer assembly (Ref.Fig.503).
  - (a) Screw the puller (Tool 155) into the end of the filter and withdraw the assembly. The puller can be used in conjunction with impact puller (Tool 1653).
  - (b) Examine the oil strainer assembly and bore for cleanliness. Remove all deposits of foreign matter.
- (5) Install the oil strainer assembly into the bore.

**CAUTION:** END OF STRAINER PROTRUDES FROM BORE WHEN FULLY INSERTED. EXERCISE CARE TO PREVENT FILTER COLLAPSING DURING INSERTION.

- (a) Insert the assembly so that the oil jet locates in the bottom of the bore.

IN20224

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Assemble the driver (Tool 1481) to the end of the oil strainer and carefully press the assembly fully into the bore.
- (c) Secure the strainer assembly with a joint washer end plate, bracket and bolts.
- (d) Apply lubricant 'A' to the bolts, and ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Place the components in position and torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

#### 6. Assemble Bearing Components to Gearbox Case

NOTE: The protective material must be removed from bearings before assembly. Bearings must also be lubricated with lubricant 'A' and protected (Ref.72-09-00, Assembly). Remove each roller assembly from its journal and suitably identify for future assembly.

##### A. Assemble Bearing Journal to Position A (Ref.Fig.508).

- (1) Place the roller assembly in a container.
- (2) Insert the parallel roller bearing journal (72-62-04/1-240) into the bore in the case. The journal is inserted from the outside of the case through the QAD coupling location.
- (3) Apply lubricant 'A' to the bolts. Assemble the load spreading washers (72-62-04/1-220) to the bolts (72-62-04/1-230).
- (4) Retain the journal with the bolts, load spreading washers and nuts (72-62-04/1-210).
  - (a) Insert the bolts from the inside of the case ensuring that the load spreading washers locate correctly under the bolt heads.
  - (b) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Assemble the nuts to the bolts and torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

##### B. Assemble Bearing Journal to Position B (Ref.Fig.508).

- (1) Place the roller assembly in a container.
- (2) Place the parallel roller bearing journal (72-62-03/1-130) on the inner surface of the gearbox case.

## OVERHAUL

- (3) Apply lubricant 'A' to the bolts (72-62-03/1-110). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the journal to the case with the bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).

### C. Assemble Bearing Journal to Position C (Ref.Fig.508).

- (1) Place the roller assembly in a container.
- (2) Place the parallel roller bearing journal (72-62-02/1-160) on the inner surface of the gearbox case.
- (3) Apply lubricant 'A' to the bolts (72-62-02/1-148). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the journal to the case with the bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).

### D. Assemble Bearing Journal to Position D (Ref.Fig.508).

- (1) Place the roller assembly in a container.
- (2) Place the parallel roller bearing journal (72-62-03/1-50) on the inner surface of the gearbox case.
- (3) Apply lubricant 'A' to bolts (72-62-03/1-30). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the journal to the case with the bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).

### E. Assemble Bearings to Oil Pump Drive Position (Ref.Fig.508).

- (1) On engines to SB.72-7510-166 and SB.72-8651-246 assemble the integral bearing (72-62-04/1-380B) to the oil pump drive position.
  - (a) Remove the parallel roller assembly from the integral bearing, identify it for later reference and place it in a container.
  - (b) Place the integral bearing in the oil pump drive shaft bore inserting it from inside the gearbox case.
  - (c) Apply lubricant 'A' to the bolts (72-62-04/1-280B), then place a load spreading washer (72-62-04/1-285A) under the head of each bolt.
  - (d) Insert the bolts through the case so that the bolt heads and washers are positioned in the oil pump section.

SUB-ASSEMBLY

## 72-62-00

OVERHAUL

- (e) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the bolts with nuts (72-62-04/1-270) torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) On engines to Pre SB.72-7510-166 assemble the ball bearing housing (72-62-04/1-420) and parallel roller bearing journal (72-62-04/1-380A) to the oil pump drive position.
- (a) Remove the parallel roller assembly from the bearing journal, identify the roller assembly and place it in a container.
  - (b) Ensure that the ball bearing journal (72-62-04/1-410) is fully pressed into the ball bearing housing and secured with a retaining ring (72-62-04/1-400).
  - (c) Apply lubricant 'A' to securing items, position the parallel roller bearing journal inside the gearbox case in the oil pump drive bore. Place the ball bearing housing on the opposite end of the bore in the oil pump chamber. Ensure that both assemblies locate correctly in the respective bore recess.
  - (d) Secure the bearings together with bolts (72-62-04/1-280A) inserted so that the boltheads are positioned on the oil pump side of the bore.
  - (e) Secure the bolts with nuts (72-62-04/1-270), ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- F. Assemble Bolt to Position E (Ref.Fig.508).
- (1) Apply lubricant 'A' to the bolt (72-62-01/5-150). Position the washer (72-62-01/5-140) under the bolt, then insert the bolt into the hole so that the bolt-head and washer locates on the upper surface of the case.
  - (2) Place a washer (72-62-01/5-130) over the protruding bolt thread and secure the bolt with a nut (72-62-01/5-120). Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nut between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

## 7. Assemble Bearings to Diaphragm

NOTE: Protective material must be removed from bearings before assembly. Bearings must also be lubricated (Ref.72-09-00, Assembly).

### A. Assemble Diaphragm to Hydraclamp (Ref.Fig.509).

- (1) Assemble the diaphragm to the holding fixture (Tool 152) and secure it to Hydraclamp (Tool 1643).

### B. Assemble Bearing to Position A (Ref.Fig.509).

- (1) Insert the bearing (72-62-04/1-40) into the bottom surface of the diaphragm.
- (2) Secure the bearing as follows:
  - (a) Apply lubricant 'A' to the bolts. Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Position the load spreading washer assembly (72-62-01/4-190) on the top surface of the diaphragm. Ensure that the pin locates fully into the diaphragm.
  - (c) Insert a bolt (72-62-01/4-200) through the load spreading washer, then secure the bolt with a nut (72-62-01/4-180) torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Position the load spreading washers (72-62-01/4-130) and (72-62-01/4-170) at the remaining two holes.
  - (e) Insert a bolt (72-62-01/4-160-120) through the hole nearest the bearing in each load spreading plate.
  - (f) Secure the bolts with nuts (72-62-01/4-110-150) torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).

### C. Assemble Bearing to Position B (Ref.Fig.509).

- (1) Assemble the bearing (72-62-03/1-100) into the top surface of the diaphragm.

SUB-ASSEMBLY

OVERHAUL

- (2) Secure the bearing as follows:
  - (a) Apply lubricant 'A' to bolts.
  - (b) Position the load spreading washer assembly (72-62-01/4-300) on the bottom surface of the diaphragm ensuring that the pin locates fully into the diaphragm.
  - (c) Insert a bolt (72-62-01/4-310) through the bearing journal flange. Secure the bolt with a nut (72-62-01/4-290) located on the load spreading washer.
  - (d) Ensure that the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nut between 67 and 73 lbf in. (7,6 and 8,2 N.m).

#### D. Assemble Bearing to Position C (Ref.Fig.509).

- (1) Assemble the bearing (72-62-02/1-30) into the bottom surface of the diaphragm.
- (2) Apply lubricant 'A' to bolts (72-62-01/4-230). Insert the bolts through the bottom surface of the assembly. Place the cover plate (72-62-01/4-220) over the protruding bolt threads, then secure the assembly with nuts (72-62-01/4-210).
- (3) Ensure that the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

#### E. Assemble Bearing Journal to Position D (Ref.Fig.509).

- (1) Remove the roller assembly from the journal (72-62-03/1-20) and identify it D. Place the roller assembly in a container. Insert the bearing journal into the bottom surface of the diaphragm.
- (2) Secure the journal as follows:
  - (a) Apply lubricant 'A' to securing items.
  - (b) Insert the bolt (72-62-01/4-280) into the hole that is common to bearing C. The bolt head locates on the bottom surface of the diaphragm assembly. Secure the bolt with a nut (72-62-01/4-270).

# OLYMPUS 593

MK.610-14-28 SNECMA  
OVERHAUL

- (c) Place a load spreading washer (72-62-01/4-250) under the head of each bolt (72-62-01/4-260). Insert the bolts through the two remaining bolt locations in the bearing journal. Secure the bolts with nuts (72-62-01/4-240).
- (d) Ensure that the nuts have a minimum locking (run-down torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the three nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

## 8. Bevel Gears Adjusting Washers Thickness Measuring Procedures

### A. Assemble Setting Gauge to Oil Pump Bevel Pinion Position (Ref. Fig.510).

NOTE: The setting gauges are stored in containers (Tools 160 and 161).

- (1) Remove the knurled nut from setting gauge (Tool 7), then assemble the parallel roller assembly (72-62-04/1-380) followed by spacer sleeve (72-62-04/1-390) to the gauge. The parallel roller assembly was previously removed from the oil pump bearing assembly.
- (2) Insert the setting gauge into the oil pump bevel pinion position so that the knurled end of the plunger protrudes into the oil pump location.
- (3) Ensure that the bearing and spacer fully engages with the integral bearing.
- (4) Screw the knurled nut onto the gauge to retain the assembly.

### B. Assemble Setting Gauge to Main Drive Bevel Pinion Position (Pre SB.72-8990-383) (Ref. Fig.510).

- (1) Remove the knurled nut from setting gauge (Tool 8), then assemble the parallel roller assembly (72-62-02/1-360) and spacer sleeve (72-62-02/1-350) to the gauge. The roller assembly was previously removed from the main drive bearing assembly.
- (2) Insert the setting gauge into the main drive bearing location so that the knurled end of the plunger protrudes outward.
- (3) Ensure that the bearing track and spacer fully engages with the integral bearing.

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (4) Screw the knurled nut onto the gauge to retain the assembly.

C. Assemble Setting Gauge to Main Drive Bevel Pinion Position (SB.72-8990-383) (Ref. Fig.510).

- (1) Remove the knurled shouldered nut from setting gauge (Tool 3144) and back-off the knurled locknut and centreing nut at opposite end of gauge.
- (2) Insert the setting gauge into the main drive bearing location so that the knurled end of the plunger protrudes outwards, ensuring the gauge is fully engaged with ball bearing inner face.
- (3) Screw the knurled shouldered nut onto the gauge and tighten to retain assembly.

NOTE: This operation should be carried out in conjunction with next operation, to ensure the setting gauge is centrally located and fully engaged in the main drive bearing location before final tightening of the knurled shouldered nut.

- (4) Tighten the centreing nut in roller bearing outer track to centre plunger.

NOTE: It may be necessary to slightly release knurled shouldered nut to allow centreing of plunger. If so, ensure shouldered nut re-tightened.

- (5) Tighten the knurled lock-nut against centreing nut.
- (6) Ensure all nuts tightened sufficiently to allow no lateral movement in the setting gauge body.

D. Assemble Setting Gauges to Diaphragm Position A and C (Ref. Fig.510).

- (1) Ensure that the diaphragm is securely attached to the holding fixture and the Hydraclamp.
- (2) Remove the knurled nut from the end of setting gauge (Tool 6), then assemble the roller assembly of bearing A (72-62-04/1-240) to the setting gauge and secure it with the knurled nut.

OVERHAUL

- (3) Remove the flanged knurled nut from the opposite end of the setting gauge and insert that end of the gauge into the bearing assembled to position A on the diaphragm. The gauge is inserted through the bottom surface of the diaphragm.
- (4) Secure the gauge with the flanged knurled nut.
- (5) Remove the knurled nut from the end of setting gauge (Tool 9). Assemble the roller assembly of bearing C (72-62-02/1-160) to the setting gauge and secure it with the knurled nut.
- (6) Remove the flanged knurled nut from the opposite end of the setting gauge and insert that end of the gauge into the bearing assembled to position C on the diaphragm. The gauge is inserted through the bottom surface of the diaphragm.
- (7) Secure the gauge with the flanged knurled nut.

E. Assemble Diaphragm and Setting Gauges to Gearbox Case (Ref. Fig.510).

- (1) Fully withdraw the plungers of the setting gauges assembled to the main drive and oil pump bevel pinion locations.
- (2) Remove the diaphragm from the holding fixture secured to the Hydraclamp.
- (3) Carefully assemble the diaphragm and setting gauges to the gearbox case.
  - (a) Ensure thorough cleanliness of all parts especially the bearings.
  - (b) Place the diaphragm in position on the gearbox case and exercise great care when entering the bearing tracks into the bearing journals. To assist roller bearing retention, lubricant 'E' may be used. Ensure that the diaphragm locates fully on the gearbox.
  - (c) Assemble the three flanged pins (72-62-01/4-40-20) to the diaphragm. Temporarily retain the pin nearest position C on the diaphragm with a bolt (72-62-01/4-10). Secure the remaining pins with bolts (72-62-01/4-30).

SUB-ASSEMBLY

MK.610-14-28 *sneema*  
OVERHAUL

- (4) Ensure that the plungers of the setting gauges at the main drive and oil pump drive positions will freely engage with the slots in the settings gauges assembled to the diaphragm. The setting gauges can be turned by hand for alignment purposes.

F. Checking Procedure for Oil Pump Bevel Pinion (Ref. Fig.510).

- (1) Fully withdraw the plunger of the setting gauge at the oil pump bevel pinion position.
- (2) Press the setting gauge plunger assembled to diaphragm position A fully inward.
- (3) Press the oil pump drive plunger fully inwards until it is in contact with the side of the diaphragm plunger. Measure and record as dimension W the resultant gap between the plunger and the cut out section of the sleeve.
- (4) Examine the bevel pinion (72-62-04/1-141) to ascertain the dimension engraved DM or MD.
- (5) Calculation to obtain thickness of adjusting washer =  $\text{Dimension W} + 1.650 \text{ in. (41,91 mm)} - \text{MD}$ .
- (6) Record the calculated thickness of an adjusting washer.
- (7) Select an adjusting washer from the appropriate range of the thickness calculated as follows:
  - (a) On engines pre SB.72-7510-166 (72-62-04/1-290A to 365A) (72-09-21 Repair, Fig.433 Sheet 1).
  - (b) On engines SB.72-8651-246 (72-62-04/1-290B to 365B) (72-09-21 Repair, Fig.433 Sheet 2).

G. Checking Procedure for Gearshaft at Diaphragm Position A (Ref. Fig.510).

- (1) Fully withdraw the plunger of the setting gauge assembled to the diaphragm at position A.
- (2) Press the plunger of the gauge assembled to the oil pump bevel pinion fully into the sleeve of the diaphragm plunger.

SUB-ASSEMBLY

## 72-62-00

Page 533

Sep 30/94

# OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (3) Press the diaphragm plunger fully inwards until it is in contact with the oil pump plunger. Measure and record as dimension X the resultant gap between the plunger and the cut out section of the sleeve.
- (4) Examine the gearshaft (72-62-04/1-142) to ascertain the dimension engraved DM or MD.
- (5) Calculated the thickness of the adjusting washer.  
Adjusting washer = Dimension X + 3.297 in. (83,74 mm) - MD - length of locating sleeve (72-62-04/1-130).
- (6) Select an adjusting washer from the range (72-62-04/1-50 to 120) (72-09-21 Repair, Fig.432) of the thickness calculated.

H. Checking Procedure for Main Drive Bevel Pinion (Ref. Fig.510).

- (1) Fully withdraw the plunger of the setting gauge at the main drive bevel pinion position.
- (2) Press the setting gauge plunger assembled to the diaphragm at position C fully inwards.
- (3) Press the main drive plunger fully inward until it is in contact with the side of the diaphragm plunger. Measure and record as dimension Z the resultant gap between the plunger and the cut out section of the sleeve.
- (4) Examine the bevel pinion (72-62-02/1-33) to ascertain the dimension engraved DM or MD.
- (5) Calculate the thickness of the adjusting washer:

Pre SB.72-8990-383, Adjusting washer =  
Dimension Z + 2.220 in. (56,38 mm) - MD.  
SB.72-8990-383, Adjusting washer =  
Dimension Z + 3.911 in. (99,339 mm) - MD.

- (6) Select an adjusting washer from the appropriate range of the thickness calculated as follows:
  - (a) On engines pre SB.72-7510-166 (72-62-02/1-270A to 335A) (72-09-21 Repair, Fig.431 (Sheet 1)).
  - (b) On engines SB.72-8651-246 (72-62-02/1-270B to 335B and 337A to 341A) (72-09-21 Repair, Fig.431 (Sheet 2)).

MK.610-14-28 *sneema*  
OVERHAUL

J. Checking Procedure for Bevel Gear at Diaphragm Position C (Ref. Fig.510).

- (1) Fully withdraw the plunger of the setting gauge assembled to the diaphragm at position C.
- (2) Press the plunger of the gauge assembled to the main drive bevel pinion fully into the sleeve of the diaphragm plunger.
- (3) Press the diaphragm plunger fully inwards until it is in contact with main drive plunger. Measure and record as dimension Y the resultant gap between the plunger and the cut out section of the sleeve.
- (4) Examine the bevel gear (72-62-02/1-132) to ascertain the dimension engraved DM or MD.
- (5) Calculate the thickness of the adjusting washer.
  - (a) On engines to Pre SB.72-90 the adjusting washer =  
Dimension Y + 2.447 in. (62,15 mm) - MD - length  
of locating sleeve (72-62-02/1-120).
  - (b) On engines to SB.72-90 the adjusting washer =  
Dimension Y + 2.447 in. (62,15 mm) - MD.
- (6) Select an adjusting washer from the appropriate range as follows:
  - (a) On engines to Pre SB.72-90 (72-62-02/1-40A to 110A) (72-09-21 Repair, Fig.430 (Sheet 1)).
  - (b) On engines to SB.72-90 (72-62-02/1-40B to 110B and 111A to 114A) (72-09-21 Repair, Fig.430 (Sheet 2)).
  - (c) On engines to SB.72-8990-383 (72-62-02/1-40 to 1-95) (72-09-21 Repair, Fig.430 (Sheet 3)).

K. Remove Setting Gauges.

- (1) Remove the bolts securing the diaphragm flanged pins, then using the puller (Tool 177) withdraw the flanged pins.
- (2) Carefully withdraw the diaphragm and setting gauges from the gearbox case. Secure the diaphragm to the holding fixture attached to the Hydraclamp.

SUB-ASSEMBLY

## 72-62-00

Page 534A  
Sep 30/94

# OLYMPUS 593

MK.610-14-28 *sneema*

## OVERHAUL

- (3) Remove each roller bearing from the diaphragm setting gauges. Ensure that each roller bearing is identified according to position A or C. Place the bearings in the appropriate protectors.
- (4) Carefully remove the setting gauges from the diaphragm. Ensure that the knurled nuts are screwed in position. Place the setting gauges in the storage container.

NOTE: The diaphragm can remain in the Hydraclamp to await the next stage of assembly.

- (5) Remove the setting gauges from the bevel pinion locations in the gearbox case. Carefully remove each bearing track and spacer sleeve from the gauges. Ensure that the bearing tracks are identified and protected.
- (6) Ensure that the knurled nuts are assembled to the setting gauges, then place the gauges in their storage containers.

## 9. Assemble Bevel Pinions to Gearbox

### A. Assemble Oil Pump Bevel Pinion (Ref. Fig.511).

CAUTION: EACH BEVEL PINION IS MATCHED WITH A CORRESPONDING GEAR AND MUST BE INTERCHANGED WITH SIMILAR COMPONENTS.

- (1) Ensure that all components are clean and damage free.
- (2) Select an adjusting washer of the previously calculated thickness from the range (72-62-04/1-290B to 365B) (72-09-21 Repair, Fig.433 Sheet 2).
- (3) Place the washer on the bevel pinion shaft (72-62-04/1-141).
- (4) Assemble the parallel roller assembly (72-62-04/1-380A) Pre SB.72-7510-166 or (72-62-04/1-380B) SB.72-7510-166 to the bevel pinion.
  - (a) Press the bearing squarely onto the shaft as far as possible by hand.
  - (b) Place the support (Tool 162) on the base plate of a suitable vertical hand press tool.

NOTE: A scalloped base plate is suitable, as the hole in the base (Tool 162) must be clear to allow the pinion shaft to pass through.

OVERHAUL

- (c) Place the bevel pinion vertically on the base. Ensure that the bearing and adjusting washer remain in position as the pinion must be positioned with the gear teeth uppermost.
  - (d) Support the assembly. Place the driver (Tool 1510) in the centre of the bevel gear section.
  - (e) Carefully apply sufficient load to the driver with the hand press to fully assemble the roller bearing to the bevel pinion shaft.
  - (f) Ensure that the bearing abuts with the adjusting washer and the adjusting washer abuts with the bevel gear rear face.
  - (g) Remove the bevel pinion and tools. Check components for cleanliness.
- (5) Place the spacer sleeve (72-62-04/1-390) on the bevel pinion shaft.
- (6) Assemble the bevel pinion to the oil pump drive location.
- (a) Position the bevel pinion in the gearbox case and enter the shaft as far as possible by hand into the integral bearing.
  - (b) Insert the draw screw (Tool 164) through the bevel pinion so that the threaded section of the tool protrudes into the oil pump chamber.
  - (c) Carefully screw the mechanical puller (Tool 163) on to the draw screw thread until it abuts the end of the bevel pinion.
  - (d) Ensure that the bevel pinion is parallel with the bearing in the case, and that the tools are correctly assembled.
  - (e) Carefully turn the handle of the mechanical puller to pull the bevel pinion fully into position.
  - (f) Check the bevel pinion for freedom of rotation when it is fully in position. Remove the puller and draw screw.
- (7) Assemble the cupwasher (72-62-04/1-260) and plain round nut (72-62-04/1-250) to the bevel pinion.
- (a) Apply lubricant 'A' to the bevel pinion thread.

SUB-ASSEMBLY

OVERHAUL

- (b) Insert the immobiliser (Tool 331) into the bevel pinion ensuring the full engagement of splines.
- (c) Engage the immobiliser bar with the hole in the immobiliser plate (Tool 332), then secure the plate to the gearbox case.
- (d) Place the cupwasher over the bevel pinion followed by the locknut tightened as far as possible by hand.
- (e) Assemble support plate (Tool 800) to the oil pump chamber flange.
- (f) Use wrench spanner (Tool 1486) and torque wrench (Tool 1656) to torque-tighten the locknut to between 110 and 120 lbf ft (149,1 and 162,7 N.m).
- (g) Remove the assembly tools and check the bevel pinion for freedom of rotation. Do not lock the cupwasher at this stage.

## B. Assemble Main Drive Spiral Bevel Pinion (Pre SB.72-8990-383) (Ref. Fig.512).

- (1) Assemble the previously removed parallel roller assembly (72-62-02/1A-260B) SB.72-7510-166 and (72-62-02/1A-260C) SB.72-8651-246 or the parallel roller bearing inner track only Pre SB.72-7510-166 to the spiral bevel pinion (72-62-02/1-133).

- (a) Apply locking compound 'B' to the bearing location on the spiral bevel pinion.
- (b) Press the bearing track squarely on the shaft as far as possible by hand.
- (c) Place the support (Tool 175) on the base plate of a suitable hand press tool.

**NOTE:** A scalloped base plate is suitable as the hole in the support (Tool 175) must be clear to allow the pinion shaft to pass through.

- (d) Place the bevel pinion vertically on the base. The gear teeth must be uppermost.
- (e) Support the assembly. Place the driver (Tool 1489) in the centre of the bevel gear section.

- (f) Carefully apply sufficient load to the driver with the hand press to fully assemble the bearing inner track to the pinion shaft.
  - (g) Remove the bevel pinion and tools. Remove all surplus locking compound and check components for cleanliness.
- (2) Place the spacer sleeve (72-62-02/1-350) next to the bearing track on the pinion shaft.
  - (3) Select an adjusting washer of the previously calculated thickness from the range (72-62-02/1-270 to 341) (72-09-21 Repair, Fig.431 (Sheet 2). Place the washer next to the spacer sleeve on the pinion shaft.
  - (4) Assemble the spiral bevel pinion to the main drive location.
    - (a) Ensure that the adjusting washer and spacer sleeve remain in position. Carefully insert the bevel shaft from the inside of the gearbox case into the main drive bearing.
    - (b) Support the bevel pinion and carefully engage the shaft thread with the mechanical puller (Tool 176) by turning the small handle of the tool.
    - (c) Ensure that the bevel pinion is parallel with the bearing in the case and that the tool is correctly assembled.
    - (d) Carefully turn the large handle of the mechanical puller to pull the bevel pinion fully into position.
    - (e) Remove the mechanical puller and check the bevel pinion for freedom of rotation.
  - (5) Assemble the locknut (72-62-02/1-200) to the pinion shaft, ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).
    - (a) Apply lubricant 'A' to the pinion thread. Restrained the pinion by hand whilst screwing the locknut as far as possible by hand on the bevel pinion thread.

MK.610-14-28 *sneema*  
OVERHAUL

- (6) Assemble the immobiliser (Tool 168) to the gearbox main drive mounting location on the assembly stand.
- (a) Engage the holder section of the tool with the bevel gear retaining nut.
- (b) Secure the immobiliser plate to the main drive adapter.
- (7) Insert the splined wrench spanner (Tool 1558) through the centre of the immobiliser and engage the splines with the bevel pinion.
- (8) Torque-tighten the retaining nut.

- (a) Using the torque wrench (Tool 1656) in conjunction with the assembled splined wrench spanner, check that the locking (run-down) torque of the locknut is between 80 and 340 lbf in. (9,0 and 38,4 N.m).

NOTE: The splined wrench spanner must be turned counter-clockwise to tighten the shaft.

- (b) Torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m) plus the measured run-down torque figure. Release the nut until a clearance is visible at the clamping face then repeat the torquing operation. Again release the nut until a clearance is visible at the clamping face then repeat the torquing operation without pausing before reaching the required clamping torque value.
- (c) Remove the tools and check the bevel pinion for free rotation.

C. Assemble Main Drive Spiral Bevel Pinion/Roller Bearing Matched Assembly (SB.72-8990-383) (Ref. Fig.512).

- (1) Select an adjusting washer of the previously calculated thickness from the range (72-62-02/1-270 to 341) (72-09-21 Repair, Fig.431 (Sheet 2)). Place the washer on the pinion shaft.

- (2) Assemble the spiral bevel pinion to the main drive location.
  - (a) Ensure that the adjusting washer remains in position. Carefully insert the bevel shaft from the inside of the gearbox case into the main drive bearing.
  - (b) Support the bevel pinion and carefully engage the shaft thread with the mechanical puller (Tool 176) by turning the small handle of the tool.
  - (c) Ensure that the bevel pinion is parallel with the bearing in the case and that the tool is correctly assembled.
  - (d) Carefully turn the large handle of the mechanical puller to pull the bevel pinion fully into position.
  - (e) Remove the mechanical puller and check the bevel pinion for freedom of rotation.
- (3) Assemble the locknut (72-62-02/1-200) to the pinion shaft, ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref. SB.72-105).
  - (a) Apply lubricant 'A' to the pinion thread. Restrain the pinion by hand whilst screwing the locknut as far as possible by hand on the bevel pinion thread.
- (4) Assemble the immobiliser (Tool 168) to the gearbox main drive mounting location on the assembly stand.
  - (a) Engage the holder section of the tool with the bevel gear retaining nut.
  - (b) Secure the immobiliser plate to the main drive adapter.
- (5) Insert the splined wrench spanner (Tool 1558) through the centre of the immobiliser and engage the splines with the bevel pinion.

- (6) Torque-tighten the retaining nut.
  - (a) Using the torque wrench (Tool 1656) in conjunction with the assembled splined wrench spanner, check that the locking (run-down) torque of the locknut is between 80 and 340 lbf in. (9,0 and 38,4 N.m).
  - NOTE: The splined wrench spanner must be turned counter-clockwise to tighten the shaft.
  - (b) Torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m) plus the measured run-down torque figure.
  - (c) Remove the tools and check the bevel pinion for free rotation.

10. Assemble Fuel Control Unit/Main Oil Pump Driving Shaft to Diaphragm

A. Prepare for Assembly.

- (1) Ensure that the diaphragm is securely attached to the holding fixture and Hydraclamp.
- (2) Check all components for cleanliness.

B. Assemble Roller Bearing to Driving Shaft (Ref. Fig.513).

NOTE: The roller bearing was previously removed from the gearbox parallel roller bearing journal at position A.

- (1) Secure the draw screw (Tool 307) vertically in a bench vice.

OLYMPUS 593

- (4) Screw the mechanical puller (Tool 306) on to the draw screw until it is in contact with the roller bearing track. Turn the puller tool handle until the roller bearing is pressed fully into position.
- (5) Remove the mechanical driver and driving shaft from the draw screw, then remove the draw screw from the vice.
- (6) Secure the roller bearing with the locknut (72-62-04/1-150), ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).
  - (a) Secure the vice holder (Tool 167) vertically in a bench vice and place the driving shaft on the holder.
  - (b) Apply lubricant 'A' to the locknut threads and screw the locknut onto the shaft as far as possible by hand.
  - (c) Using the wrench spanner (Tool 1487) in conjunction with torque wrench (Tool 1648), check that the locking (run-down) torque of the locknut is between 6 and 50 lbf ft (8,1 and 67,8 N.m).
  - (d) Use the torque wrench (Tool 1656) to torque-tighten the locknut between 65 and 70 lbf ft (88,1 and 94,9 N.m) plus the measured run-down torque figure.
  - (e) Remove the spanners from the locknut, withdraw the driving shaft from the vice holder and remove the vice holder from the bench vice.

C. Assemble Gearshaft to Driving Shaft and Secure to Diaphragm (Ref.Fig.514).

- (1) Slide the gearshaft (72-62-04/1-142) over the splined section of the driving shaft, ensuring that the bevelled section of the gear abuts the driving shaft.
- (2) Slide the locating sleeve (72-62-04/1-130) on the driving shaft. Ensure that the sleeve locates fully in the recess at the end of the gearshaft.
- (3) Select an adjusting washer of the previously calculated thickness from the range (72-62-04/1-50 to 120). Place the adjusting washer next to the locating sleeve on the driving shaft.

- (4) Install the shaft assembly in the diaphragm.
  - (a) Ensure that the adjusting washer and locating sleeve are not dislodged from the shaft assembly.
  - (b) Carefully enter the shaft as far as possible by hand into the bearing at position A (Ref. Fig.514). The shaft is inserted through the bottom surface of the diaphragm. Support the shaft during the following procedures.
  - (c) Insert the draw screw (Tool 165) into the drive shaft ensuring that the threaded end protrudes through the diaphragm end of the shaft. Support the assembly.
  - (d) Screw the mechanical puller (Tool 203) on to the draw screw until it is in contact with the diaphragm ball bearing track.
  - (e) Carefully turn the puller tool handle until the shaft is pulled fully into the bearing.
  - (f) Remove the draw screw and puller. Check the shaft for free rotation in the diaphragm.
- (5) Assemble the retaining nut to the shaft assembly.
  - (a) Secure the vice holder (Tool 166) in a bench vice.
  - (b) Support the driving shaft during transfer of the assembly to the vice holder. Remove the diaphragm from the holding fixture and place the gear shaft in the vice holder.
  - (c) Apply lubricant 'A' to the threads. Assemble a flat washer (72-62-04/1-30), cupwasher (72-62-04/1-20) and retaining nut (72-62-04/1-10) to the driving shaft.
  - (d) Using the wrench spanner (Tool 1511) in conjunction with the torque wrench (Tool 1656), torque-tighten the retaining nut between 110 and 120 lbf ft (149,1 and 162,7 N.m).

- (g) Remove the vice holder from the bench vice.

# 11. Assemble Main Drive Gear Shaft to Diaphragm

## A. Assemble Roller Bearing to Gear Shaft.

NOTE: The roller bearing was previously removed from the gearbox position C parallel roller bearing journal. For basic similarity of assembly (Ref.Fig.513).

- (1) Check all components for cleanliness.
- (2) Secure the draw screw (Tool 180) vertically in a bench vice.
- (3) Press the roller bearing (72-62-02/1-160) on the gear shaft (72-62-02/1-170 pre SB.72-90 or 1-138 SB.72-90) as far as possible by hand. Carefully place the gear shaft on the draw screw ensuring that the roller bearing is uppermost.
- (4) Screw the mechanical puller (Tool 185) on to the draw screw until it is in contact with the roller bearing.
- (5) Carefully turn the puller tool handle to press the bearing fully into position. Disassemble the tools and remove the gear shaft.
- (6) Secure the roller bearing with the locknut (72-62-02/1-150), ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).
  - (a) Secure the vice holder (Tool 303) to a bench vice and place the gear shaft in the holder ensuring that the roller bearing is uppermost.
  - (b) Apply lubricant 'A' to the locknut threads and screw the locknut onto the shaft as far as possible by hand.

- (c) Using the wrench spanner (Tool 1509) in conjunction with the torque wrench (Tool 1648), check that the locking (run-down) torque of the locknut is between 4 and 18.3 lbf ft (5,4 and 24,8 N.m).
  - (d) Using the torque wrench (Tool 1656) to torque-tighten the locknut between 45 and 50 lbf ft (61,0 and 67,8 N.m) plus the measured run-down torque figure.
  - (e) Remove the spanners from the locknut. Invert the gear shaft in the vice holder to assist the following dimensional check.
- B. Assemble Spiral Bevel Gear to Gear Shaft and Secure to Diaphragm (Pre SB.72-8990-383) (Ref. Fig.515).
- (1) Measure the distance from the end of the shaft to the edge of the bearing location and record as dimension A. This dimension will be included in a later dimensional calculation.
  - (2) On engines to pre SB.72-90 apply locking compound 'B' to the gear shaft (Ref.Fig.515). Wear protective gloves to prevent contact with the locking compound.
    - (a) Ensure that components are thoroughly clean, dry and free from grease then apply the locking compound to the surfaces indicated.
- NOTE: The locknut (72-62-02/1-10) detailed in the following operations must be torque-tightened within fifteen minutes of applying locking compound to the gear shaft.
- (b) Slide the spiral bevel gear (72-62-02/1-132) over the splined section of the gear shaft ensuring that the bevelled section of the gear abuts the gear shaft.
  - (c) Slide the locating sleeve (72-62-02/1-120) onto the gear shaft. Ensure that the sleeve locates fully in the recess at the end of the spiral bevel gear. Remove surplus locking compound.
  - (d) Remove the gear shaft from the vice holder in preparation for assembly to the diaphragm. Ensure that the adjusting washer locating sleeve and spiral bevel gear are not dislodged. The vice holder can remain in the bench vice for later use.

SUB-ASSEMBLY

OVERHAUL

C. Assemble Spiral Bevel Gear and Secure to Diaphragm  
(SB.72-8990-383) (Ref. Fig.515).

(1) Assemble bevel gear to the diaphragm.

- (a) Place the adjusting washer of previously calculated thickness next to the spiral bevel gear (72-62-02/1-143). The washer was selected from the range (72-62-02/1-40 to 1-95) (72-09-21 Repair, Fig.430 Sheet 3).
- (b) Enter the shaft as far as possible by hand into the bearing at position C (Ref. Fig.515) on the diaphragm. Support the assembly.
- (c) Insert the draw screw (Tool 180) into the drive shaft ensuring that the screw section protrudes through the diaphragm end of the shaft. Support the assembly.
- (d) Screw the mechanical puller (Tool 179) on to the draw screw until it is in contact with the diaphragm roller bearing track. Carefully turn the puller tool handle to pull the gear shaft assembly fully into position. Remove the draw screw and puller tool. Check the shaft for free rotation.
- (e) Support the shaft during transfer of the assembly to the vice holder. Remove the diaphragm from the holding fixture and place the gear shaft in the previously used vice holder (Tool 303).

(2) Secure the gearshaft to the diaphragm with the locknut (72-62-02/1-10) SB.72-55, ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref. SB.72-105).

- (a) Apply lubricant 'A' to the locknut threads and place the locknut on the shaft.

(3) Torque-tighten the locknut.

- (a) Support the assembly and using the wrench spanner (Tool 1491) in conjunction with the torque wrench (Tool 1648) check that the locking (run-down) torque of the locknut is between 8.3 and 34.0 lbf ft. (11,3 and 46,0 Nm).

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (b) Torque-tighten the locknut between 120 and 130 lbf ft (162,7 and 176,3 N.m) plus the measured run-down torque figure.
- (4) Withdraw the gear shaft from the vice holder and place the diaphragm/bevel gear assembly in a protective container. Remove the vice holder from the bench vice.

## 12. Bevel Gear Backlash and Engagement Checks

### A. Assemble Diaphragm and Gear Shafts in Gearbox Case (Ref. Fig.516).

- (1) Ensure that all bearing assemblies and bevel gears are clean.
- (2) Apply a thin coating of engineers marking blue to the teeth of the bevel gears attached to the diaphragm.
- (3) Place the diaphragm assembly in the gearbox and ensure that the roller bearings locate fully in the bearing journals. To assist roller bearing retention, lubricant 'E' may be used. Carefully press the diaphragm into the gearbox to ensure that it is fully located.
- (4) Rotate the oil pump drive and main drive bevel pinions to prove engagement with the gear shafts.

- (5) Assemble the three flanged pins (72-62-01/4-20-40) to the diaphragm. Temporarily retain the pin at position E with a bolt (72-62-01/4-10). Secure the pins at position F with bolts (72-62-01/4-30).
- (6) Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

## B. Backlash Checking Procedure (Ref. Fig.516).

- (1) Assemble the immobiliser (Tool 189) to the Fuel Control Unit (FCU) driving end of gear shaft A. This is located under gear shaft A.
  - (a) Secure the immobiliser to the flange at the QAD coupling location. Enter the expander section of the tool into the gear shaft.
  - (b) Turn the wingnut until the expander immobilises the shaft, then lock the knurled nut located on the side of the tool.
- (2) Assemble the immobiliser (Tool 188) to the main drive gear shaft at position C on the diaphragm.
  - (a) Secure the immobiliser to the gearbox case/cover unit flange. Enter the expander section of the tool into the gear shaft.

**CAUTION:** IT IS IMPORTANT THAT THE KNURLED NUT IS NOT LOCKED IN POSITION UNTIL THE GEARWHEEL IS FULLY LOADED INTO MESH.

- (b) Turn the wingnut until the shaft is immobilised with the gearwheel loaded into mesh, then lock the knurled nut.
- (3) Assemble the backlash indicating fixture (Tool 190) to the oil pump bevel pinion and the backlash indicating fixture (Tool 953) to the main drive bevel pinion shaft.
  - (a) Insert the expander section of each tool into the respective bevel pinion shaft, then secure the tools by tightening the wingnuts.

**NOTE:** These tools can be assembled and set in conjunction with the dial indicator gauges in the following sequences.

OVERHAUL

- (4) Install the dial indicator gauges at the oil pump and main drive locations to check the backlash of the bevel pinions.
  - (a) Secure a dial indicator gauge with 0.001 in. (0,025 mm) graduations to the fixture at each position. The stylus of the gauge must locate between the two engraved lines on the arm of each backlash indicating fixture.
  - (b) With the main drive bevel pinion loaded out of mesh, check and record the total dial indicator movement of the main drive bevel. Check that the backlash figures obtained are within the limits quoted in the Fits and Clearances Schedule (FCS-278).
  - (c) Check and record the total dial indicator movement of the oil pump drive bevel. Check that the backlash figures obtained are within the limits quoted in the Fits and Clearances Schedule (FCS-316).
  - (d) Investigate incorrect backlash and rectify.
- (5) On satisfactory completion of the checks, remove the immobilisers and indicating fixtures.

C. Bevel Gear Teeth Engagement Checking Procedure.

- (1) Rotate each bevel pinion in turn to ensure that all teeth have been in contact with the blue coated gear shaft bevels.

NOTE: When implementing the procedure detailed in para.(1) for the main drive bevels, the procedure detailed in para.(2) is used.
- (2) With the main drive gearshaft (wheel) loaded out of mesh and the main drive bevel (pinion) loaded into mesh, using Tool Kit 3145, rotate the pinion anti-clockwise such that the pinion convex flank drives the wheel concave flank.
- (3) Remove the bolts and flanged pins securing the diaphragm to the gearbox. Use the puller (Tool 177) and withdraw the pins. Carefully withdraw the diaphragm and gear shafts from the gearbox.

OLYMPUS 593

MK.610-14-28 SNECMA  
OVERHAUL

- (4) Inspect the teeth of both bevel pinions to ascertain the amount of engagement with the corresponding gear shaft bevels.
- (5) Acceptance limits for oil pump drive bevel gear engagement.
  - (a) Not less than 30 per cent surface contact on each gear tooth must be evident.
  - (b) Investigate and rectify insufficient gear teeth engagement.
- (6) Acceptance limits for main drive bevel gear engagement.
  - (a) The contact pattern must conform to that shown in Fig.516A. If the contact pattern is not acceptable, refer to sub-paras (6)(b) and (6)(c) for rectification procedures.
  - (b) Rectify unacceptable contact pattern.

**CAUTION:** IT IS IMPORTANT TO ENSURE THAT THE PROCEDURE DETAILED IN PARA.(2) HAS BEEN STRICTLY ADHERED TO BEFORE CARRYING OUT ANY CORRECTIVE ACTION.

- (i) Contact pattern run off the toe end of the pinion: move the pinion out of mesh by reducing the pinion adjusting washer thickness until the contact pattern is wholly on the tooth. Check that in doing this, the tip margin on the wheel is still acceptable.
- (ii) Toe contact high on the pinion and low on the wheel (Ref, Fig.516A): move the pinion out of mesh by reducing the pinion adjusting washer thickness in increments of approximately 0.003 in (0.076 mm) until the tip margin is equal on both gears.
- (iii) Toe contact low on the pinion and high on the wheel (Ref Fig.516A): move the wheel out of mesh by reducing the wheel adjusting washer thickness in increments of approximately 0.003 in. (0.076 mm) until the tip margin is equal on both gears.

OVERHAUL

(c) Re-check the backlash to ensure that it is in excess of the minimum specified in the fits and clearance 72-62-00 (601-278). If backlash unacceptable, investigate and rectify.

(7) Remove the marking blue on completion of satisfactory bevel gear engagement checks. Do not lock the cup-washers at this stage.

(8) Assemble the diaphragm/gear shaft assembly to the holding fixture (Tool 152) and secure the fixture to the Hydraclamp.

13. Assemble Stage 1 Fuel Pump Drive Gear Shaft to Diaphragm

A. Assemble Roller Bearing to Gear Shaft (Ref. Fig.517).

NOTE: The roller bearing was previously removed from the gearbox bearing journal at position B.

- (1) Check all components for cleanliness.
- (2) Secure the draw screw (Tool 182) vertically in a bench vice.
- (3) Press the roller bearing (72-62-03/1-130) squarely on the gear shaft (72-62-03/1-180) as far as possible by hand.
- (4) Carefully place the gear shaft on the draw screw ensuring that the roller bearing is uppermost.
- (5) Screw the mechanical puller (Tool 181) onto the draw screw until it is in contact with the roller bearing track.
- (6) Carefully turn the puller tool handle to press the bearing fully into position.
- (7) Remove the mechanical puller and gear shaft from the draw screw, then remove the draw screw from the vice.

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (8) Secure the roller bearing with locknut (72-62-03/1-120), ensuring that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).
- (a) Secure the vice holder (Tool 178) vertically in a bench vice and place the gear shaft on the holder with the roller bearing uppermost.
  - (b) Apply lubricant 'A' to the locknut threads and screw the locknut on the shaft as far as possible by hand.
  - (c) Using the wrench spanner (Tool 1566) in conjunction with the torque wrench (Tool 1648) check that the locking (run-down) torque of the locknut is between 80 and 340 lbf in. (9,0 and 38,4 N.m).

OVERHAUL

(d) Using the torque wrench (Tool 1656) torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m) plus the measured run-down torque figure.

(9) Ensure that the diaphragm is secured to the holding fixture (Tool 152) and Hydraclamp.

(10) Remove the gear shaft from the vice holder in preparation for assembly to the diaphragm. The vice holder can remain in the vice for later use.

B. Assemble Gear Shaft to Diaphragm (Ref.Fig.517).

- (1) Enter the shaft as far as possible into the bearing at diaphragm position B. Support the assembly.
- (2) Insert the draw screw (Tool 180) into the gear shaft ensuring that the screw section protrudes through the diaphragm end of the shaft. Support the assembly.
- (3) Screw the mechanical puller (Tool 179) on to the draw screw until it is in contact with the diaphragm ball bearing track.
- (4) Carefully turn the puller tool handle to pull the shaft fully into position.
- (5) Remove the draw screw and puller tool. Check the gear shaft for free rotation in the diaphragm.
- (6) Insert the quillshaft (72-62-03/1-140) fully into the gear shaft.
- (7) Secure the shaft assembly to the diaphragm.
  - (a) Apply lubricant 'A' to the retaining nut (72-62-03/1-70).
  - (b) Place the flat washer (72-62-03/1-90) over the end of the shaft. The washer abuts the bearing.
  - (c) Place the cupwasher (72-62-03/1-80) on the flat washer.
  - (d) Screw the retaining nut hand-tight onto the shaft thread.

OVERHAUL

- (8) Remove the diaphragm from the Hydraclamp adapter. Place the gear shaft in the previously used vice holder (Tool 178). Support the assembly.
- (9) Use the wrench spanner (Tool 1490) in conjunction with torque wrench (Tool 1648) to torque-tighten the retaining nut between 110 and 120 lbf ft (149,1 and 162,7 N.m). Do not lock the cupwasher.
- (10) Remove the spanners from the gear shaft. Suitably protect the diaphragm and gear shafts assembly. Remove the vice holder from the bench vice.
- (11) Assemble oil trap washer (72-62-03/1-170) to the recess inside the gear shaft at the end to which the roller bearing has been assembled. Secure the oil trap washer with retaining ring (72-62-03/1-160).

#### 14. Assemble Roller Bearings to Idler Spur Gear

##### A. Assemble Large Bearing to Gear Shaft.

NOTE: This roller bearing was previously removed from the gearbox bearing journal at position D.

- (1) Secure the draw screw (Tool 182) vertically in a bench vice.
- (2) Press the roller bearing (72-62-03/1-50) squarely on the gear shaft as far as possible by hand.
- (3) Carefully place the gear shaft on the draw screw with the roller bearing uppermost.
- (4) Screw the mechanical puller (Tool 181) on to the draw screw until it is in contact with the roller bearing track.
- (5) Carefully turn the puller tool handle to press the bearing fully into position.
- (6) Remove the puller tool and gear shaft from the draw screw then remove the draw screw from the bench vice.
- (7) Secure the vice holder (Tool 304) to a bench vice and place the gear shaft in the holder with the roller bearing uppermost.

- (8) Apply lubricant 'A' to the locknut (72-62-03/1-40) threads and screw the locknut onto the shaft as far as possible by hand. Ensure that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).
- (9) Using the wrench spanner (Tool 1566) in conjunction with torque wrench (Tool 1648) check that the locking (run-down) torque of the locknut is between 80 and 340 lbf in. (9,0 and 38,4 N.m).
- (10) Using the torque wrench (Tool 1656), torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m) plus the measured run-down torque figure.
- (11) Remove the spanners and gear shaft from the vice holder. Remove the vice holder from the bench vice.

## B. Assemble Small Bearing to Gear Shaft.

NOTE: This roller bearing was previously removed from the diaphragm bearing journal at position D.

- (1) Secure the draw screw (Tool 184) vertically in a bench vice.
- (2) Press the roller bearing (72-62-03/1-20) squarely on the shaft as far as possible by hand.
- (3) Carefully place the gear shaft over the draw screw with the roller bearing uppermost.
- (4) Screw the mechanical puller (Tool 185) on to the draw screw until it is in contact with the roller bearing track.
- (5) Carefully turn the puller tool handle to press the bearing fully into position.
- (6) Remove the puller tool and gear shaft from the draw screw then remove the draw screw from the bench vice.
- (7) Secure the vice holder (Tool 304) to a bench vice and place the gear shaft in the holder with the roller bearing uppermost.
- (8) Apply lubricant 'A' to the locknut (72-62-03/1-10) and screw the locknut onto the shaft as far as possible by hand. Ensure that the self-locking feature of the nut is elliptical and not four lobed (Ref.SB.72-105).

OVERHAUL

- (9) Using the wrench spanner (Tool 1509) in conjunction with torque wrench (Tool 1648) check that the locking (run-down) torque of the locknut is between 4 and 35 lbf ft (5,4 and 47,5 N.m).
- (10) Using the torque wrench (Tool 1656), torque-tighten the locknut between 45 and 50 lbf ft (6,1 and 67,8 N.m) plus the measured run-down torque figure.
- (11) Remove the spanners and gear shaft from the vice holder, then remove the vice holder from the bench vice.
- (12) Assemble protectors (Tool 191 and 192) to the bearings and place the gear shaft in the tray (Tool 1229).

#### 15. Check Backlash of Spur Gears

##### A. Assemble Diaphragm/Gear Shafts to Gearbox Case (Ref. Fig.518).

- (1) Ensure thorough cleanliness of all components especially the bearings. Also ensure that each roller bearing assembly is complete.
- (2) Place the idler spur gear shaft (72-62-03/1-60) in the gearbox case. Ensure that the large roller bearing fully locates in the bearing journal at position D.
- (3) Assemble the diaphragm and gear shafts to the gearbox case.
  - (a) Place the diaphragm/gear shaft assembly into the gearbox case. Turn the gear shafts as necessary to engage the gear train. To assist roller bearing retention, lubricant 'E' may be used. Ensure that the roller bearings fully engage with the bearing journals and that the diaphragm locates fully in the gearbox case.
- (4) Assemble the three flanged pins (72-62-01/4-20 and 40) to the diaphragm and temporarily retain the pin at position E with a bolt (72-62-01/4-10). Secure the pins at position F with bolts (72-62-01/4-30).
- (5) Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

B. Backlash Checking Procedure (Ref.Fig.518).

- (1) Assemble the immobiliser (Tool 188) to the main drive gear shaft on the diaphragm at position C.
  - (a) Secure the immobiliser to the gearbox case/cover unit flange. Enter the expander section of the tool into the gear shaft.
  - (b) Turn the wingnut until the expander immobilises the shaft, then lock the knurled nut.
- (2) Assemble the backlash indicating fixture (Tool 911) to the idler spur gear shaft that protrudes through the diaphragm at position D.
  - (a) Insert the expander section of the tool into the gear shaft, then secure the tool by tightening the wingnut.
- (3) Install a dial indicator gauge and check the spur gear backlash.
  - (a) Secure a dial indicator with (0.001 in. (0,025 mm) graduations) to the fixture so that the stylus locates on the engraved line 'A' on the backlash indicating fixture arm.
  - (b) Check and record the total dial indicator movement. Check that the backlash figures obtained are within the limits quoted in the Fits and Clearances Schedule (FCS-304).
- (4) Remove the immobiliser from the main drive gear shaft at position C.

NOTE: The backlash indicating fixture and dial indicator must remain in position for the following backlash checks.
- (5) Assemble the immobiliser (Tool 912) to the stage 1 fuel pump drive gear shaft on the diaphragm at position B.
  - (a) Secure the immobiliser to the gearbox case/cover unit flange. Enter the expander section of the immobiliser into the gear shaft.
  - (b) Turn the wingnut until the shaft is immobilised, then lock the knurled nut.
- (6) Adjust the dial indicator so that the stylus locates on the engraved line 'B' on the backlash indicating fixture arm.

- (7) Check and record the total dial indicator movement. Check that the backlash figures obtained are within the limits quoted in the Fits and Clearances Schedule (FCS-282).
- (8) Remove the immobiliser from the drive gear shaft at position B.
- (9) Assemble the immobiliser (Tool 189) to the FCU driving end of gear shaft A. This is located under gear shaft A (Ref.Fig.516).
  - (a) Secure the immobiliser to the flange at the QAD coupling location. Enter the expander section of the tool into the gear shaft.
  - (b) Turn the wingnut until the expander immobilises the shaft, then lock the knurled nut located on the side of the tool.
- (10) Check and record the total dial indicator movement. Check that the backlash figures obtained are within the limits quoted in the Fits and Clearances Schedule (FCS-290).
- (11) On completion of the check remove the immobiliser, dial indicator and backlash indicating fixture.

#### 16. Assemble Quillshaft to FCU/Main Oil Pump Driving Shaft

##### A. Assemble Oil Feed Sleeve to Quillshaft (Ref.Fig.519).

- (1) Assemble the oil trap sleeve (72-62-04/1-170) to the oil feed sleeve (72-62-04/1-180).
  - (a) Ensure thorough cleanliness of components.
  - (b) Assemble the oil trap sleeve to the driver (Tool 1505).
  - (c) Press the oil trap sleeve into the oil feed sleeve and ensure that it locates fully in position. Remove the driver tool.
- (2) Assemble the oil feed sleeve to the quillshaft (72-62-04/1-190).
  - (a) Place the support tool (Tool 194) on a support plate so that the flange section is supported. Place the quillshaft in the support tool.

- (b) Insert the oil feed sleeve into the quillshaft and press it fully into position with the driver (Tool 193).
- (c) Secure the oil feed sleeve to the quillshaft with a retaining ring (72-62-04/1-160).
- (d) Remove the quillshaft from the holder and remove the holder from the support plate.

B. Assemble Quillshaft to Driving Shaft.

- (1) Remove the diaphragm/gear shaft assembly from the gearbox case.
  - (a) Remove the bolts securing the diaphragm to the gearbox case. Using the puller (Tool 177) remove the flanged pins.
  - (b) Carefully withdraw the diaphragm and gear shafts from the gearbox case. Ensure that the loose idler gear is not accidentally dislodged.

NOTE: The idler gear can remain in position in the gearbox case.

- (c) Protect the gearbox from ingress of dirt.
- (2) Secure the vice holder (Tool 166) in a bench vice and place the drive shaft A with the diaphragm attached, in the vice holder. Ensure that the diaphragm does not rotate during the following sequences.

CAUTION: HOLD DRIVING SHAFT TO PREVENT IT FALLING FREE WHEN RETAINING NUT IS REMOVED.

- (3) Use the wrench spanner (Tool 1511), remove the driving shaft locknut from the diaphragm location. Support the gear shaft when the locknut is removed.
- (4) Insert the quillshaft into the driving shaft and ensure that it locates fully in position.
- (5) Apply lubricant 'A' to the locknut threads. Ensure that the flat washer (72-62-04/1-30) and cupwasher (72-62-04/1-20) are in position on the driving shaft, then assemble the locknut (72-62-04/1-10) to the driving shaft.

- (6) Using the wrench spanner (Tool 1511) in conjunction with torque wrench (Tool 1656), torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m), then remove the spanners from the locknut.

#### 17. Assemble Diaphragm and Front Cover to Gearbox Case

##### A. Assemble Diaphragm and Gear Shafts (Ref.Fig.520).

- (1) Ensure thorough cleanliness of all components. Apply lubricant 'A' to securing items. Ensure that each roller bearing assembly is complete.
- (2) Ensure that the idler spur gear is correctly installed in the gearbox.
- (3) Assemble the diaphragm and gear shafts to the gearbox case.
  - (a) Place the diaphragm/gear shaft assembly into the gearbox case. Turn the gear shafts as necessary to engage the gear train. To assist roller bearing retention, lubricant 'E' may be used. Ensure that the roller bearings fully engage with the bearing journals and that the diaphragm locates fully in the gearbox case.
- (4) Check the rotational movement of the gear train by turning the main drive bevel pinion.

##### Note ...

Gear train movement should be smooth with no evidence of tight spots. Tight spots may indicate distortion of bearing outer races and must be investigated. Possible causes of such distortion are dee-head bolt contact, (Ref. Note in Para.2.B.(15) (g), and uneven fretting of gearcase bearing location faces.

- (5) Secure the diaphragm to the gearbox case with the three flanged pins (72-62-01/4-20 and 40) and bolts positioned as follows:
  - (a) Near the gear shaft at position A secure the flanged pin with a bolt (72-62-01/4-30).
  - (b) Between the gear shafts at positions B and C secure the flanged pin with a bolt (72-62-01/4-30).

- (c) Near the gear shaft at position C secure the flanged pin with a bolt (72-62-01/4-10).
- (6) Ensure that the bolts have a minimum locking (run-down torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Secure the diaphragm at the remaining positions.
  - (a) Ensure that the nuts and bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Secure the load spreading plates positioned near the gear shaft at position A with bolts (72-62-01/4-140 and 100). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Assemble the locknuts (72-62-01/4-320) to the bolts near the gear shaft at position B. Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Secure the assembly near the gear shaft at position C with a load spreading washer (72-62-01/4-60) and nut (72-62-01/4-50). Torque-tighten the nut between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Lock the gear shaft cupwashers at positions A, B and at the oil pump location.
  - (a) Carefully lock each cupwasher at three equal positions into the retaining nuts.

B. Assemble Front Cover Unit (Ref.Fig.520).

**NOTE:** Refer to SB.72-9 for provisions attached to use of front cover (72-62-01/3-40C).

- (1) Examine components for cleanliness and ensure that all sealing surfaces are damage free. Apply lubricant 'A' to the securing bolts.

- (2) Place the gasket (72-62-01/3-310) on the gearbox flange and carefully place the cover unit into position. Secure the cover with the following items at the specified positions.
  - (a) At the previously installed flanged pin locations at position A with bolts (72-62-01/3-110) and at position B with a bolt (72-62-01/3-130).
  - (b) At position C with load spreading washers (72-62-01/3-80) and bolts (72-62-01/3-70).
  - (c) At position D with load spreading washers (72-62-01/3-100) and bolts (72-62-01/3-90).
  - (d) At the remaining bolt positions, with load spreading washers (72-62-01/3-60) and bolts (72-62-01/3-50).
- (3) Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the securing bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (4) Ensure that the gear train rotates freely.
- (5) Assemble protectors to all open ports.

#### 18. Assemble Rear Cover and QAD Couplings

##### A. Assemble Rear Cover (Ref.Fig.521).

- (1) Examine all components for cleanliness. Ensure that all joint surfaces are free of damage. Apply lubricant 'A' to all securing items.
- (2) Place a gasket (72-62-01/7-210) in position on the gearbox flange and place the cover (72-62-01/7-120) over the joint flange.
- (3) Insert the three flanged pins (72-62-01/7-140) into the cover and secure each pin with a bolt (72-62-01/7-130).
- (4) Assemble the bolts (72-62-01/7-150) and load spreading washers (72-62-01/7-160) to the remaining positions.

- (5) Assemble the bracket (72-62-01/7-190) to the cover bolt locations.
  - (6) Ensure that the bolts have a minimum locking (run-down torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- B. Assemble Fuel Control Unit QAD Coupling to Rear of Gearbox Case (Ref.Fig.521, detail A).
- (1) Apply lubricant 'A' to the securing bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (2) Assemble the seal ring (72-62-01/6-90) (SB.0L593-72-8995-401) and coupling ring (72-62-01/6-50) to the flange coupling (72-62-01/6-40).
  - (3) Ensuring correct location on the dowels, assemble the gasket (72-62-01/6-100) and coupling assembly to the rear of the gearbox case.
  - (4) Secure the coupling ring assembly to the case with bolts (72-62-01/6-30). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (5) Assemble the retaining bracket (72-62-01/6-150).
    - (a) Place the bracket in position near the QAD coupling.
    - (b) Secure the bracket with two hollow pins (72-62-01/6-120) bolts (72-62-01/6-130) bracket (72-62-01/6-140A) Pre SB.72-131 or plate washer (72-62-01/6-140B) SB.72-131 and locknuts (72-62-01/6-110).
    - (c) Torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (6) Assemble a spherical washer (72-62-01/6-20) to the bolt (72-62-01/6-10), then loosely assemble the bolt and washer to the retaining bracket.
  - (7) Assemble the protector (Tool 222) to the QAD coupling location.

C. Assemble Stage 1 Fuel Pump QAD Coupling to Front Cover  
(Ref.Fig.521, detail B).

- (1) Apply lubricant 'A' to the securing bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (2) Assemble the 'O' ring (72-62-01/2-100) (SB.0L.593-72-8995-401) and coupling ring (72-62-01/2-60) to the flange coupling (72-62-01/2-50).
- (3) Ensuring correct location on the dowels, assemble the gasket (72-62-01/2-110) and coupling ring to the front cover.
- (4) Secure the coupling ring assembly to the cover unit with seven bolts (72-62-01/2-40) and nine bolts (72-62-01/2-30). Use torque wrench (Tool 1664) to torque-tighten the bolts to 100 lbf in. (11,5 N.m).
- (5) Assemble the retaining bracket (72-62-01/2-150).
  - (a) Position the bracket at the location on the end of the cover near the QAD coupling.

SUB-ASSEMBLY

- (b) Secure the bracket with bolts (72-62-01/2-140) plate washer (72-62-01/2-130) and locknuts (72-62-01/2-120).
- (c) Torque-tighten the nuts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Assemble the spherical washer (72-62-01/2-20) to the bolt (72-62-01/2-10), then loosely assemble the bolt and washer to the retaining bracket.
- (7) Assemble the protector (Tool 222) to the QAD coupling location.

#### 19. Assemble Main Oil Pump and Pulse Probe to Gearbox Case

##### A. Assemble Oil Pump (Ref.Fig.522).

- (1) Examine all components for cleanliness and ensure that all joint surfaces are damage free. Remove protectors as necessary.
- (2) Place the gasket (72-65-00/1-470) on the gearbox flange.
- (3) Remove the cover and bracket from the lifting fixture location on the oil pump and note the position of the bracket. Assemble the lifting fixture (Tool 93) to the pump, ensuring that the securing bolts are evenly tightened.
- (4) Position the oil pump in readiness for assembly to the gearbox case.
- (5) Insert the quillshaft (72-65-00/3-120) fully into the pump.
- (6) Assemble the oil pump to the gearbox, ensuring that the quillshaft and oil transfer hollow pin locate correctly into the gearbox. Secure the oil pump to the gearbox case as follows:

NOTE: Bolt holes position numbers are shown on sheet 2 (Ref.Fig.522).

- (a) Apply lubricant 'A' to bolt threads.
- (b) Insert a flanged pin (72-65-00/1-150-280-410) into the gearbox flange at positions 9, 25 and 35.
- (c) Secure the pump at position 9 with a bolt (72-65-00/1-140).

- (d) Insert a bolt (72-65-00/1-290) through the gearbox flange at position 25. Secure the bolt with a load spreading washer (72-65-00/1-270) and locknut (72-65-00/1-260).
- (e) Place the trap washer (72-65-00/1-420) on the pillar bolt (72-65-00/1-430) then insert the pillar bolt through the pump flange at position 35 and secure it with a locknut (72-65-00/1-400) (Ref.Fig.522 sheet 1 inset G).
- (f) Insert the pillar bolts (72-65-00/1-460) through the trap washer and pump flange at positions 36 and 37 and secure each bolt with a load spreading washer (72-65-00/1-450) and locknut (72-65-00/1-440) (Ref.Fig.522 sheet 1 inset G).
- (g) Place a load spreading washer (72-65-00/1-170) under the head of each bolt (72-65-00/1-180), then insert the bolts through the gearbox flange at positions 5, 6, 11, 12, 13, 14, 15 and 26 and secure with load spreading washers and locknuts (72-65-00/1-170-160).
- (h) Place a load spreading washer (72-65-00/1-240) under the head of each bolt (72-65-00/1-250A) Pre-Mod.7608 or (72-65-00/1-250B) Mod.7608, then insert the bolts through the pump case at positions 20, 21 and 22 and secure with load spreading washers and locknuts (72-65-00/1-240-230) (Ref.Fig.522 sheet 1 inset F).
- (j) Place bracket (72-65-00/1-60) followed by load spreading washers (72-65-00/1-40) on bolts (72-65-00/1-50). Insert the bolts through the oil pump flange at positions 1 and 2. Place load spreading washers (72-65-00/1-40) on the bolts followed by the bracket (72-65-00/1-70A) Pre-SB.72-47 or (72-65-00/1-70B) SB.72-47 and locknuts (72-65-00/1-30) (Ref.Fig.522 sheets 1 and 2 inset E).
- (k) Place a load spreading washer (72-65-00/1-20) under the head of each bolt (72-65-00/1-10) then insert the bolts through the gearbox flange at positions 3, 4, 10, 18, 19, 23, 24 and 27 and screw in hand-tight.
- (l) Place the bracket (72-65-00/1-130A) Pre-SB.72-47 or (72-65-00/1-130B) SB.72-47 followed by load spreading washer (72-65-00/1-120) on the bolts (72-65-00/1-110). Insert the bolts through the gearbox flange at positions 7 and 8 and screw in hand-tight (Ref.Fig.522 sheet 2 inset A).

OVERHAUL

- (m) Place a flat washer (72-65-00/1-200) on each bolt (72-65-00/1-210) then insert the bolts through the gearbox case flange at positions 16 and 17 and place a load spreading washer over the protruding threads. Place the bracket (72-65-00/1-220) over the bolt threads and secure with two nuts (72-65-00/1-190) (Ref.Fig.522 sheets 1 and 2 inset D).
- (n) Place the bracket (72-65-00/1-330) on the bolts (72-65-00/1-300) then screw the bolts into the gearbox flange at positions 30 and 31 (Ref.Fig.522 sheet 2 inset C).
- (p) Insert bolts (72-65-00/1-300) through the bracket (72-65-00/1-320). Assemble the bracket to positions 28 and 29. Insert a load spreading washer (72-65-00/1-310) between the bracket and the gearbox flange at position 28. Screw the bolts into position hand-tight (Ref.Fig.522 sheet 2 inset C).
- (q) Place the bracket (72-65-00/1-390) on the bolt (72-65-00/1-360) then screw the bolt into the gearbox flange at position 32 (Ref.Fig.522 sheet 2 inset B).
- (r) Insert bolts (72-65-00/1-360) through the bracket (72-65-00/1-380). Assemble the bracket to positions 33 and 34. Insert a load spreading washer (72-65-00/1-370) between the bracket and the gearbox flange at position 34. Screw the bolts into position hand-tight (Ref.Fig.522 sheet 2 inset B).
- (7) Ensure that the nuts and bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts and bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (8) Remove the lifting fixture from the oil pump and assemble the previously removed cover and bracket.
  - (a) Ensure that the gasket (72-65-00/5-120) is in position.
  - (b) Apply lubricant 'A' to the bolts (72-65-00/5-90). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the cover and bracket with the bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).

B. Assemble Pulse Probe (Ref.Fig.523).

- (1) Check the clearance gap between the phonic wheel in the gearbox and the pulse probe.

Assembling Pulse Probe  
Figure 523

- (a) Measure the distance from the locating face of the pulse probe flange to the tip of the pulse probe. Record as dimension A.
  - (b) Measure the distance from the locating face of the pulse probe flange on the gearbox case to the phonic wheel teeth in the gearbox. The measuring instrument must span two teeth of the phonic wheel. Record as dimension B.
  - (c) Deduct dimension A from B. The result must be within 0.009 and 0.021 in. (0,2286 and 0,5334 mm).
- (2) Assemble the pulse probe.
- (a) Assemble the seal (76-12-02/1-50) to the probe (76-12-02/1-10A) Pre SB.76-10 or (76-12-02/1-10B) SB.76-10, then assemble the probe/seal to the gearbox engaging the probe pin in its hole.
  - (b) Apply lubricant 'A' to the securing bolts (76-12-02/1-20), then secure the probe with the bolts, ensuring that they have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

## 20. Oil Flow Test and Pressure Test Gearbox Assembly

### A. Test Equipment Required.

- (1) Capable of a flow rate up to 110 gal/h (Imp.) (500 litres/hour) of oil at a temperature of 120 deg C with a delivery pressure up to 50 psig (344 Kpa) to the gearbox.
- (2) Oil specification Lubricant A.

### B. Assemble Pressure Test Equipment to Gearbox Assembly (Ref.Fig.524). Components indicated thus \* are stored in container (Tool 799).

- (1) Remove protectors and assemble items to the following oil pump locations. Ensure thorough cleanliness of all components before assembly.
  - (a) Position A, blank adapter (Tool 705).\*
  - (b) Position B, blank (Tool 218).\*

OVERHAUL

- (c) Position C, blank (Tool 219).\*
  - (d) Position D, adapter oil scavenge (Tool 217).\*
  - (e) Position E, blank (Tool 281).\*
- (2) Remove protectors and assemble items to the following front cover and gearbox locations.
- (a) Position F, oil pressure adapter (Tool 704).\*
  - (b) Position G, QAD coupling location blank (Tool 650) and seal (FBS 1254).
  - (c) Position H, QAD coupling location blank (Tool 650).

NOTE: Ensure that the QAD coupling ring engages freely with each blank. An eight ounce (226.796 g) hammer and soft metal driver is recommended for tightening the coupling ring.

- (d) Position J blank (Tool 150).\*
- (3) Assemble the drain valve adapter assembly (Tool 915) to position K main drive location.
- (a) Remove the adapter (Tool 867) from the main drive location.
  - (b) Assemble the drain valve adapter assembly to the main drive location and secure it with bolts (Tool 86). Ensure that the drain valve is closed.
- C. Prepare Pressure Test/Flow Check Mobile Equipment (Ref.Fig.506 and 507).
- (1) Ensure that an adequate amount of oil is contained in the pressure test equipment. Suitable protective clothing must be worn to minimise personal contact with the oil.
  - (2) Connect the flowmeter electrical plug and instrumentation plug to the respective locations on the mobile pressure test equipment.
  - (3) Connect the oil pressure hose to the adapter on the front cover.

SUB-ASSEMBLY

**72-62-00**

Page 578

Dec 1/82

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (4) Connect the oil scavenge hose to the adapter on the oil pump case.
- (5) Connect the pressure test equipment to a mains electricity supply of 30 A 600 V a.c. Ensure that the circulating pump is switched OFF.

D. Flow Check Gearbox Assembly.

- (1) Open the return stop valve on the mobile pressure test equipment, switch ON the circulating pump and adjust the pressure controller to give a delivery oil pressure of not more than 5 psig (34 Kpa) for circulating and venting purposes. Ensure that the flowmeter is functioning.
- (2) Carefully release trapped air from the gearbox by opening the vent tap on the oil pump at position A (Ref.Fig.524). Close the vent tap when all air has been expelled.
- (3) Place the transparent protection cover (Tool 797) over the gearbox assembly and check to ensure that the gearbox assembly is clearly visible from all angles. Check the assembly for leakage.

**WARNING:** TRANSPARENT PROTECTION COVER MUST NOT BE REMOVED WHILST GEARBOX IS PRESSURIZED WITH OIL. ADEQUATE VENTILATION IS ESSENTIAL. PROTECTIVE CLOTHING MUST BE WORN.

- (4) Switch on the oil heater and heat the oil to a convenient temperature between 20 and 120 deg C. When the circulating oil is at the required temperature allow approximately 5 minutes for stabilization of gearbox case temperature then switch OFF the circulating pump. Carefully release trapped air from the gearbox.
- (5) On completion of venting, switch ON the circulating pump and adjust the oil pressure to give a differential of 30 psig (207 Kpa) between the oil inlet and outlet pressures.
- (6) Maintain the oil flow pressure level and record the oil flow rate indicated by the flowmeter.

SUB-ASSEMBLY

72-62-00

Page 579

Dec 1/82

OLYMPUS 593

OVERHAUL

- (7) To be acceptable, the total flow through the gearbox must be within the limits shown in the graph relevant to the Service Bulletin standard of the engine as follows:
- (a) Engines incorporating Service Bulletins 72-9, 72-12 and 72-7851-32 (preferred standard) - refer to Fig.525.
  - (b) Engines incorporating Service Bulletins 72-9 and 72-12 (controlled flow standard) - refer to fig.526.
  - (c) Engines incorporating Service Bulletins 72-9 and 72-7851-32 (reduced flow standard) - refer to Fig.527.
- (8) On completion of satisfactory flow test switch OFF the oil heater and circulating pump. Switch off the electricity supply to the equipment and disconnect the oil flowmeter. Ensure that the flowmeter is safely stored.

E. Pressure Test Gearbox Assembly.

- (1) Open the return stop valve on the mobile pressure test equipment, switch ON the electricity supply and circulating pump and adjust the pressure controller to give a delivery pressure of not more than 5 psig (35 Kpa) for circulating and venting purposes.

**WARNING:** TRANSPARENT PROTECTION COVER MUST NOT BE REMOVED WHILST GEARBOX IS PRESSURIZED WITH OIL. ADEQUATE VENTILATION IS ESSENTIAL. PROTECTIVE CLOTHING MUST BE WORN.

- (2) Ensure that the transparent protection cover is correctly positioned over the gearbox. Switch ON the oil heater to raise the oil temperature to 120 deg C.
- (3) Switch OFF the circulating pump and carefully release trapped air from the gearbox by opening the vent tap on the oil pump at position A (Ref.Fig.524).
- (4) Close the vent tap when all air has been expelled and switch ON the circulating pump.
- (5) Maintain the oil temperature at 120 deg C plus or minus 5 deg C. Adjust the pressure controller to give a delivery pressure of 50 psig (345 Kpa). Adjust the return stop valve to achieve a pressure differential of 40 psig (276 Kpa) in the gearbox assembly.
- (6) Maintain the pressure test condition for 15 minutes and examine the gearbox for oil leakage or seepage.
- (7) Oil leakage is unacceptable, but slight seepage of oil can be accepted.

**NOTE:** An oil leak is considered as drops or globules of oil forming within the specified time and conditions of the pressure test. Oil seepage is considered as oil dampness which may spread but does not form a droplet or globule within the specified time and conditions of the pressure test.

- (8) Any disturbance of oil carrying components after pressure test will necessitate complete pressure test.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

F. Remove Equipment After Satisfactory Flow/Pressure Test.

- (1) Switch OFF the circulating pump and oil heater. Disconnect the pressure test equipment electrical plug from the mains supply.
- (2) Open the return stop valve.
- (3) Allow sufficient time for the assembly to cool to a safe handling temperature, then drain the oil from the gearbox into a clean receptacle by opening the drain valve at position K, and the vent tap at position A (Ref.Fig.524). Return the drained oil to the mobile pressure test equipment.
- (4) Disconnect the oil pressure and scavenge hoses from the assembly and remove pressure test blanks and adapters.
- (5) Remove external deposits of oil from the gearbox, ensure thorough cleanliness of components. Place pressure test components in the appropriate container.

21. Investigate and Rectify Unsatisfactory Oil Flow

NOTE: Before commencing disassembly of gearbox components for examination of oil jets, examine the mobile pressure test equipment and associated items for possible malfunction.

A. Prepare for Investigation and Rectification.

- (1) Ensure that the pressure test equipment is switched OFF and isolated from the electricity supply.
- (2) Allow sufficient time for the assembly to cool to a safe handling temperature, then drain the oil from the gearbox into a clean receptacle by opening the drain valve at position K, and the vent tap at position A (Ref.Fig.524). Return the drained oil to the mobile pressure test equipment.
- (3) Disconnect the oil pressure and scavenge hoses from the gearbox assembly and remove pressure test blanks and adapters from the gearbox and front cover as necessary. Reassemble the protectors.

SUB-ASSEMBLY

72-62-00

Page 581

Sep 1/75

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Position the gearbox assembly so that the front cover is in the horizontal position and uppermost in readiness for removal.

**B. Rectification Procedure.**

- (1) Remove the oil strainer located at B (Ref.Fig.503).

- (a) Remove the cover and bracket from the oilway then screw the puller (Tool 155) into the end of the strainer and withdraw the assembly.

- (b) Examine the strainer assembly and bore for obstruction. Clean as necessary.

- (2) Install the oil strainer assembly.

CAUTION: END OF STRAINER PROTRUDES FROM BORE WHEN FULLY INSERTED. EXERCISE CARE TO PREVENT STRAINER COLLAPSING DURING INSERTION.

- (a) Insert the assembly so that the oil jet locates in the bottom of the bore.

- (b) Assemble the driver (Tool 1481) to the end of the oil strainer and carefully press the assembly fully into the bore.

- (c) Secure the strainer assembly with the previously removed items. Apply lubricant A to the bolts, and ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Place the components in position and torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (3) Examine the oil jets located in the bores near the QAD couplings.

- (4) Remove front cover for examination of oil filters and jets.

- (a) Remove the QAD coupling ring retaining bolt and spherical washer, then remove the bolts securing the coupling to the front cover and carefully remove the coupling flange and seal from the front cover.

- (b) Remove the bolts and load spreading washers securing the front cover to the gearbox. Carefully separate the joint flanges by using puller (Tool 1021).

TN31521

SUB-ASSEMBLY

**72-62-00**

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Examine the hollow pin and oil jet strainer assembly located at position B (Ref.Fig.502). If necessary remove the strainer assembly as follows:
- (a) Use puller (Tool 154) with impact puller (Tool 1653) to remove the hollow pin.
  - (b) Use puller (Tool 156) with impact puller (Tool 1653) to remove the oil strainer assembly from the bore.
  - (c) Examine the oil strainer assembly and bore for obstruction and clean as necessary.
- (6) Install the oil strainer assembly.
- (a) Shrink the hollow pin with a freezing agent.
  - (b) Insert the oil strainer so that the oil jet locates in the bottom of the bore. Ensure that the assembly is fully in position.
  - (c) Assemble the hollow pin to the bore to hold the assembly in position. Use driver (Tool 153) to assemble the hollow pin.
- (7) Examine the hollow pin bore located at position A (Ref.Fig.502).
- (8) Examine the oil jets assembled to the cover. If it is necessary to remove oil jets or filters, assemble the front cover to the Hydraclamp and holding fixture (Tool 151) before commencing removal (Ref.Fig.501).
- (9) On completion of investigation re-assemble the appropriate items to the front cover (Ref.para.2.B.).
- NOTE: If the cause of restricted oil flow is not revealed continue the investigation procedure. If the cause of flow restriction has been removed assemble the front cover to the gearbox (Ref.para.17.B.) and repeat the flow test procedure (Ref.para.20).
- (10) Gain access to the gearbox oil jets for investigation by removing the nuts and bolts securing the diaphragm to the gearbox at the following positions (Ref.Fig.520).
- (a) Near gear shaft A, remove the outer bolts only from the two load spreading plates. Do not remove the bolts positioned near the gear shaft.

SUB-ASSEMBLY

**72-62-00**

Page 583

Apr 1/76

- (b) Near gear shaft B, remove the two outer locknuts.
  - (c) Near gear shaft C, remove the locknut and load spreading washer.
  - (d) Remove the bolts securing the three flanged pins and use the puller (Tool 177) to withdraw the pins from the diaphragm. Note the positions of the bolts for re-assembly.
- (11) Carefully withdraw the diaphragm and attached gears from the gearbox. Place the assembly in a protective container.
- (12) Carefully remove the idler gear from the gearbox and place it in the tray (Tool 1229).
- (13) Examine the oil jets assembled to the gearbox. Remove the jets from the gearbox if necessary.
- (a) Unscrew and remove the oil jet located in the bottom of the gearbox case. If the jet and bore are satisfactory screw the jet fully in position and tighten it.
  - (b) Remove the bolt securing the oil jet to the bore at the QAD coupling location on the rear face of the gearbox case. If the jet and bore are satisfactory secure the jet to the gearbox with the bolt lubricated with lubricant A.
  - (c) Ensure that the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten it between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (14) Examine the jets assembled to the main drive location of the gearbox. If it is necessary to remove the jets proceed as follows commencing with the removal of the main drive spiral bevel pinion (Ref.Fig.528).
- (a) Assemble the main drive adapter (Tool 867) to the gearbox mounting adapter and secure it with nuts.
  - (b) Assemble the immobiliser (Tool 168) to the gearbox main drive mounting location on the assembly stand mounting plate. Engage the tool with the bevel pinion retaining nut and secure the immobiliser plate to the mounting plate.

OVERHAUL

- (c) Insert the splined wrench spanner (Tool 1558) through the centre of the immobiliser and engage the splines with the bevel pinion.
  - (d) Turn the splined wrench spanner in a clockwise direction to unscrew and release the bevel pinion.
  - (e) Remove the splined wrench spanner and immobiliser from the gearbox case.
  - (f) Assemble the mechanical driver (Tool 220) to the location from which the immobiliser was removed. Turn the handle of the tool until the bevel pinion is completely removed from the bearing. Ensure that the spacer sleeve and adjusting washer are not removed from the pinion shaft. Place the assembly in the tray (Tool 1229).
  - (g) Remove the nuts and bolts securing the oil jets to the main drive location, remove the oil jets. Do not disturb the nuts and bolts securing the bearing. Note the positions of both jets.
  - (h) Examine the oil jets and bore for evidence of obstruction. Rectify as necessary.
- (15) Assemble the jets to the main drive location (Ref.Fig.528).
- (a) Apply lubricant A to the bolts and ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Place the oil jets in position and secure with nuts and bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (16) Assemble the spiral bevel pinion to the main drive location (Ref.Fig.512).
- (a) Ensure thorough cleanliness of components. Check to ensure that the spacer sleeve and adjusting washer are assembled to the pinion shaft. The adjusting washer chamfer must face toward the threaded end of the shaft.
  - (b) Carefully insert the bevel shaft from the inside of the gearbox case into the main drive bearing. Engage the shaft thread with the mechanical puller (Tool 176) by turning the small handle of the tool.

SUB-ASSEMBLY

**72-62-00**

Page 586

MK.610-14-28  
OVERHAUL

- (c) Ensure that the bevel pinion is parallel with the bearing in the case and that the tool is correctly assembled. Carefully turn the large handle of the mechanical puller to pull the bevel pinion fully into position.
- (d) Remove the tool and check the bevel pinion for freedom of rotation.
- (17) Assemble the locknut to the pinion shaft.
  - (a) Apply lubricant A to the pinion thread. Restrain the pinion by hand whilst screwing the locknut as far as possible by hand on the bevel pinion thread.
- (18) Assemble the immobiliser (Tool 168) to the gearbox main drive mounting location on the assembly stand.
  - (a) Engage the holder section of the tool with the bevel gear retaining nut.
  - (b) Secure the immobiliser plate to the main drive adapter.
- (19) Insert the splined wrench spanner (Tool 1558) through the centre of the immobiliser and engage the splines with the bevel pinion.
- (20) Torque-tighten the retaining nut.
  - (a) Using the torque wrench (Tool 1656) in conjunction with the assembled splined wrench spanner, check that the locking (run-down) torque of the locknut is between 80 and 340 lbf ins (9,0 and 38,4 N.m).

NOTE: The splined wrench spanner must be turned counter-clockwise to tighten the shaft.

- (b) Torque-tighten the locknut between 110 and 120 lbf ft (149,1 and 162,7 N.m) plus the measured locking (rundown) torque. Release the nut until a clearance is visible at the clamping face then repeat the torquing operation. Again release the nut until a clearance is visible at the clamping face then repeat the torquing operation without pausing before reaching the required clamping torque value. Remove the tools and check the bevel pinion for free rotation.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Insert the checking gauge (Tool 10) into the bevel pinion splines to ascertain that no distortion has occurred.
- (21) Assemble diaphragm gear shafts to gearbox case (Ref.Fig.520).
- (a) Ensure thorough cleanliness of all components especially the bearings. Also ensure that each roller bearing assembly is complete. Check that the minimum locking (run-down) torque of the nuts and bolts is 3.5 lbf in. (0,4 N.m).
- (b) Place the idler spur gear in the gearbox case. Ensure that the large roller bearing fully locates in the bearing journal at position D.
- (c) Place the diaphragm/gear shaft assembly into the gearbox case. Turn the gear shafts as necessary to engage the gear train. To assist roller bearing retention, lubricant 'E' may be used. Ensure that the roller bearings fully engage with the bearing journals and that the diaphragm locates fully in the gearbox case.
- (d) Check the rotational movement of the gear train by turning the main drive bevel pinion.
- (e) Assemble the flanged pins to the diaphragm, apply lubricant A to the securing bolts and secure the flanged pins with the bolts at positions noted during removal. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (f) Secure the load spreading plates positioned near the gear shaft at position A with bolts (72-62-01/4-140 and 100). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (g) Assemble the locknuts (72-62-01/4-320) to the bolts near the gear shaft at position B. Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (h) Secure the assembly near the gear shaft at position C with a load spreading washer (72-62-01/4-60) and nut (72-62-01/4-50). Torque-tighten the nut between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

(22) Assemble front cover to gearbox (Ref.Fig.520).

- (a) Examine components for cleanliness and ensure that all sealing surfaces are damage free. Apply lubricant A to the securing bolts.
- (b) Place the gasket (72-62-01/3-310) on the gearbox flange and carefully place the cover into position.
- (c) At the flanged pin positions A secure the cover with bolts (72-62-01/3-110) and at position B with a bolt (72-62-01/3-130).
- (d) At positions C secure the cover with load spreading washers (72-62-01/3-80) and bolts (72-62-01/3-70).
- (e) At positions D secure the cover with load spreading washers (72-62-01/3-100) and bolts (72-62-01/3-90).
- (f) At the remaining bolt positions secure the cover with load spreading washers (72-62-01/3-60) and bolts (72-62-01/3-50).
- (g) Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the securing bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m). Ensure that the gear train rotates freely.

(23) Assemble QAD coupling to front cover (Ref.Fig.521, detail B).

- (a) Apply lubricant A to securing items. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
- (b) Assemble Corruplus seal (72-62-01/2-100) and coupling ring to the flange coupling. Place the gasket (72-62-01/2-110) in position on the front cover then place the coupling ring assembly over it ensuring correct location on the dowels.
- (c) Secure the coupling ring assembly with seven bolts (72-62-01/2-40) and nine bolts (72-62-01/2-30). Torque-tighten the bolts to 100 lbf in. (11,5 N.m) using torque wrench (Tool 1664).
- (d) Assemble the spherical washer to the bolt, then loosely assemble the bolt and washer to the retaining bracket.

SUB-ASSEMBLY

OVERHAUL

C. Repeat Flow Check.

- (1) Assemble the previously removed pressure test blanks and adapters to the gearbox and front cover and connect the oil pressure and scavenge hoses to the respective locations (Ref.Fig.524).
- (2) Repeat the flow test procedure (Ref.Para.20.D).

22. Investigate and Rectify Oil Leakage

A. Prepare for Investigation and Rectification.

- (1) Ensure that the pressure test equipment is switched OFF and isolated from the electricity supply.
- (2) Allow sufficient time for the assembly to cool to a safe handling temperature, then drain the oil from the gearbox into a clean receptacle by opening the drain valve at position K, and the vent tap at position A (Ref.Fig.524). Return the drained oil to the mobile pressure test equipment.
- (3) Disconnect the oil pressure and scavenge hoses from the gearbox assembly and remove pressure test equipment from the gearbox and front cover as necessary.
- (4) If leakage between joint faces is attributed to insufficient tightness of bolts, re-check the torque values in accordance with the tightening procedures detailed in the appropriate sections of this sub-assembly.
- (5) If leakage between joint faces cannot be rectified by torque-tightening checks, it will be necessary to separate the appropriate flange joints for further investigation.

B. Rectify Oil Leakage From QAD Couplings (Ref.Fig.521).

- (1) Remove QAD couplings.

NOTE: This procedure applies to the couplings assembled to the gearbox front cover or gearbox case.

- (a) Remove the coupling ring retaining bolt and spherical washer, then remove the bolts securing the coupling to the gearbox or front cover and carefully remove the coupling flange and seal.

FN31531

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (b) Examine all components and sealing surfaces, especially gaskets and seal rings for cause of leakage. Thoroughly clean all components.
- (2) Renew defective components and assemble the coupling to the rear face of the gearbox.
  - (a) Apply lubricant A to the securing bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Assemble a seal ring (72-62-01/6-90) and coupling ring to the flange coupling ring.
  - (c) Place a gasket (72-62-01/6-100) in position on the rear of the gearbox case and place the coupling assembly over it ensuring correct location on the dowels. Secure the coupling ring assembly with bolts (72-62-01/6-30). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (d) Assemble the spherical washer to the bolt then loosely assemble the bolt and washer to the retaining bracket.
- (3) Renew defective components and assemble the coupling to the gearbox front cover.
  - (a) Apply lubricant A to the securing items. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Assemble a Corruplus seal (72-62-01/2-100) and coupling ring to the flange coupling ring.
  - (c) Place a gasket (72-62-01/2-110) in position on the front cover and place the coupling ring assembly over it ensuring correct location on the dowels. Secure the coupling ring with seven bolts (72-62-01/2-40) and nine bolts (72-62-01/2-30). Torque-tighten the bolts to 100 lbf in. (11,5 N.m).
  - (d) Assemble the spherical washer to the bolt then loosely assemble the bolt and washer to the retaining bracket.

C. Rectify Oil Leakage From Front Cover Joint.

- (1) Remove QAD coupling (Ref.B.(1)).

SUB-ASSEMBLY

OVERHAUL

- (2) Remove the bolts and load spreading washers securing the front cover to the gearbox. Note the positions of bolts removed. Carefully separate the joint flanges by using puller (Tool 1021).
- (3) Examine sealing surfaces and gasket for cause of leakage. Thoroughly clean all components and replace the gasket if necessary.
- (4) Assemble the front cover to the gearbox (Ref.Fig.520).
  - (a) Apply lubricant A to the securing bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Place the gasket (72-62-01/3-310) on the gearbox flange and carefully place the cover into position.
  - (c) Secure the cover with bolts at the positions noted during removal of cover. Torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (5) Assemble the QAD coupling to the front cover (Ref.B.(3)).

D. Rectify Oil Leakage From Rear Cover Joint.

- (1) Remove the bolts and load spreading washers securing the cover, then separate the joint flanges by use of puller (Tool 1021). Note the position of the bracket.
- (2) Examine sealing surfaces and gasket for cause of leakage. Thoroughly clean all components and replace the gasket if necessary.
- (3) Assemble the rear cover to the gearbox with the previously removed bolts and load spreading washers. Ensure that the bracket is positioned as noted during removal.
  - (a) Apply lubricant A to the bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).

OVERHAUL

E. Rectify Oil Leakage From Oil Pump/Gearbox Joint.

- (1) Assemble the lifting fixture (Tool 93) to the oil pump in preparation for removal of the oil pump (Ref.Fig.522 sheet 1).
  - (a) Remove the cover and bracket from the lifting fixture location on the oil pump. Note the position of the bracket. Assemble the lifting fixture to the oil pump and attach a crane hoist to the fixture.
- (2) Remove the nuts, bolts and load spreading washers securing the pump flange to the gearbox flange. Note the position of securing items and brackets removed.
- (3) Separate the flange joints by use of puller (Tool 1021) which can be screwed into the tappings near the flanged pins positions. Ensure that residual oil drains into the drip tray.
- (4) Carefully withdraw the oil pump and ensure that the quillshaft does not fall free. Remove the quillshaft and place it in a protective container.
- (5) Examine sealing surfaces and gasket for cause of leakage. Thoroughly clean all components and replace the gasket if necessary.
- (6) Assemble the oil pump to the gearbox (Ref.Fig.522).
  - (a) Insert the quillshaft fully into the pump.
  - (b) Apply lubricant 'A' to securing items.
  - (c) Place the gasket (72-65-00/1-470) on the gearbox flange then carefully secure the oil pump to the gearbox ensuring that the quillshaft and oil transfer hollow pin locate correctly into the gearbox.
  - (d) Secure the oil pump to the gearbox with securing items in the positions noted during removal. Ensure that the brackets are correctly positioned.
  - (e) Ensure that the nuts and bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten the nuts and bolts to between 90 and 100 lbf in. (10,2 and 11,3 N.m).

OVERHAUL

- (7) Remove the lifting fixture from the oil pump and assemble the previously removed cover and bracket.
  - (a) Ensure that the gasket (72-65-00/5-120) is in position.
  - (b) Apply lubricant 'A' to the bolts (72-65-00/5-90). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the cover and bracket with the bolts torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

F. Rectify Oil Leakage From Pulse Probe/Gearbox Case Joint.

- (1) Remove the bolts securing the pulse probe to the gearbox then carefully withdraw the probe.
- (2) Examine the sealing surfaces for cause of leakage. Thoroughly clean the sealing surfaces.
- (3) Assemble the pulse probe.

NOTE: If the pulse probe is to be replaced, check the clearance gap between the phonic wheel in the gearbox and the replacement probe (Para.19.B.).

- (a) Apply lubricant 'A' to the securing bolts and ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Secure the probe to the gearbox with the bolts torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

G. Repeat Pressure Test (Ref.Fig.524).

- (1) Assemble the previously removed pressure test blanks and adapters to the gearbox and front cover and connect the oil pressure and scavenge hoses to the respective locations (Ref.Fig.524).
- (2) Repeat the pressure test procedure and remove the equipment (Ref.Para.20.E. and F).

23. Prepare Gearbox Assembly for Despatch

A. Prepare Gearbox Assembly.

- (1) Thoroughly examine the assembly for cleanliness and completion of all operations to this stage.

- (2) Examine the driving shaft for cleanliness and freedom from damage.
- (3) Assemble the retaining ring (72-62-02/1-190A) Pre-SB.72-36 or (72-62-02/1-190B) SB.72-36 to the driving shaft.
- (4) Assemble protectors to the following oil pump locations (Ref.Fig.529). Protectors are stored in container (Tool 279).
  - (a) Position A, protector (Tool 124).
  - (b) Position B, protector (Tool 122).
  - (c) Position C, protector (Tool 123).
  - (d) Position D, protector (Tool 120).
  - (e) Position E, protector (Tool 282).
- (5) Assemble protectors to the following gearbox locations (Ref.Fig.529). Protectors are stored in container (Tool 279).
  - (a) Position F, protector (Tool 222).
  - (b) Position G, protector (Tool 201).
  - (c) Position H, protector (Tool 199).
  - (d) Position J, protector (Tool 222).
- (6) Slacken the bolts securing the angled bracket to the mounting adapter. Withdraw the pressure test adapter from the gearbox and assemble the following items to the location from which the pressure test adapter has been withdrawn (Ref.Fig.529, inset view K).
  - (a) Apply lubricant 'A' to the securing bolts. Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Place the gasket (72-62-01/7-250) in position followed by the flanged connector (72-62-01/7-240).
  - (c) Secure the assembly with five bolts (72-62-01/7-220) and one bolt (72-62-01/7-230) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SUB-ASSEMBLY

**72-62-00**

Page 596

- (d) Assemble a protector to the connector.
- (7) Assemble the following items oil inlet flange on the front cover (Ref.Fig.529, inset view L).
  - (a) Apply lubricant 'A' to the securing bolts (72-62-01/3-10). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m).
  - (b) Place the gasket (72-62-01/3-35) SB.72-15 on the flange face followed by the end plate (72-62-01/3-30) and support bracket (72-62-01/3-20).
  - (c) Secure the assembly with bolts torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**B. Remove the Gearbox Assembly from the Stand.**

- (1) Assemble the lifting fixture (Tool 285) to position J on the gearbox (Ref.Fig.529).
  - (a) Adjust the assembly stand so that the rear face of the gearbox is uppermost. Ensure that the lifting fixture is thoroughly clean.
  - (b) Remove the protector from the QAD coupling location.
  - (c) Slacken the QAD coupling ring bolt and place the lifting fixture in position on the QAD coupling location.
  - (d) Engage the QAD coupling ring with the lifting fixture and tighten the bolt.
- (2) Carefully transfer the gearbox from the assembly stand to a transport pallet.
- (3) Remove the lifting fixture from the gearbox and install the protector (Tool 222) to the QAD coupling location.

**C. Final Inspection and Despatch.**

- (1) Ensure that the identification plate (72-00-04/1-90) is marked with the engine serial number. For details of marking procedure (Ref.72-09-00, Assembly).

OVERHAUL

RIGHT-HAND ACCESSORY GEARBOX - SUB-ASSEMBLY

1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general information.
- B. During the sub-assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. nuts, bolts, washers, bearings, gears, housings, tubes etc. The item will be identified as follows: e.g. bolt (1-10), the 1 referring to the I.P.C. Fig.No. and the 10 referring to the item No. In order to shorten reference numbers both Fig. and item number will be prefixed only by their Right-Hand Gearbox breakdown number e.g. (01/1-10) and shall be deemed as being 72-63-(01/1-10). Where items from a different breakdown are introduced, the breakdown number will be quoted in full e.g. bolt (79-34-01/1-10).
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturer's Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- D. Apply lubricant 'A' to all nuts and bolts etc. employed in the retaining of items in the Sub-assembly procedure prior to torque-tightening.
- E. During the sub-assembly procedure, where the thickness of adjusting washers has to be determined, the words 'select' or 'select from the range' are used. If a range of washers is not available, it may be necessary to machine the washer to achieve the desired thickness. The information for machining washers is given under chapter 72-09-21 Repair. During the assembly procedure, the machining procedure reference will be given immediately after each adjusting washer I.P.C. Ref.No. in the appropriate part of the text e.g. select from the range the correct thickness adjusting washer (3-70) (72-09-21 Repair, Fig.401).
- F. On the completion of the gearbox build, relevant oil flow and pressure checks, the gearbox is assembled to the intermediate case in order to select adjusting plates for the mounting brackets. After removal from the intermediate case the gearbox is returned for assembly of the module identification plate.

OVERHAUL

## 2. Assemble the Right-Hand Gearbox

### A. Assemble Shrink Fit Items to Right-Hand Gearbox Case (Ref.Fig.501).

NOTE: The following procedure is required to be carried out only if the gearbox case is a new item.

- (1) Place the gearbox case in a preheated oven controlled at 150 deg C for approx. 30 minutes.
- (2) On engines Pre.SB.72-83 assemble the two jet strainer ends (01/9-30) to the strainer element (01/9-60).
- (3) On engines embodying SB.72-83 Parts 1, 2 and 3 assemble the strainer extension (01/9-40) to the strainer element (01/9-60).

NOTE: Strainers element/strainers extension (SB.72-83 Parts 1,2 and 3) must only be embodied in a Pre SB.72-83 standard gearbox case, while SB.72-83 Part 4 introduces a new strainer element which must be assembled to an SB.72-83 standard case.

- (4) Place the items listed in Table 501 into an approved freezing agent (10 to 15 minutes approx. in Cardice or 2 to 3 minutes approx. in liquid nitrogen), the removal time to coincide with the removal of the gearbox case from the oven.
- (5) Using protective gloves remove the gearbox case from the oven on completion of its heating period, and place on a suitable working surface.
- (6) Using protective gloves remove the frozen item from the freezing agent. Assemble to their specified locations with appropriate tools, as detailed in Table 501.

NOTE: Hollow pins, which have a thread tapped in them to facilitate removal, must be assembled with the threaded portion uppermost.

ITEM	LOCATION	TOOL
Hollow pin (01/9-140 or 140B SB.72-24)	Front cover mounting face	Driver (514)
Scavenge hollow pin (01/4-370 or 370B SB.72-24)	Front cover mounting face	Driver (517)
Pressure hollow pin (01/4-300 or 300B SB.72-24)	Front cover mounting face	Driver (516)

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) On engines Pre. SB.72-83 remove the front sleeve (01/9-10) on engines embodying SB.72-83 remove the jet (01/9-50) from the freezing agent. Assemble the front sleeve or jet to its location in rear of the main hydraulic pump mounting face.

- (a) Assemble the rear sleeve or jet into the holder and fully engage the thread of the driver (Tool 518) into the sleeve or jet, ensuring that the flat on the head is aligned with the corresponding flat on the inside diameter of the holder.

NOTE: Jet (01/9-50A) SB.72-83 part 2 must only be assembled to a pre SB.72-83 case and jet (01/9-50B) SB.72.83 part 3 or 4 must only be assembled to a SB.72-83 standard case.

- (b) Position the step on the holder into the cut-away in the rear face of the adapter, and drift the oil sleeve or jet into its location. Ensure that the head of the sleeve is flush with, or just below the cut-away lip.

- (8) Remove the two stepped pins (01/7-110) from the freezing agent and using the gauge (Tool 42) to correctly align the flats on the pins square to the bore of the main hydraulic pump drive orifice, drift the pins into their locations with the driver (Tool 665).

- (9) Remove the strainer housing (01/9-120) from the freezing agent and assemble it to its location at the base of the main vertical bevel gear drive, using the guide (Tool 491) and driver (Tool 492) as follows.

- (a) Assemble the guide (Tool 491) to the strainer housing location and secure with three bolts.

NOTE: Due to the flat on the guide it will only fit in one position.

- (b) Assemble the driver (Tool 492) to the strainer housing, align the lugs to their corresponding castellations and driver pin on the locator to the oilway in the strainer housing. Retain by screwing the threaded holder into the strainer housing.

OVERHAUL

- (c) Assemble the locating tool/strainer housing to the guide, ensuring that the pin in the locator aligns with the slot in the guide. Drift the holder/strainer housing into its location ensuring that the strainer housing contacts the bottom of the case location.
  - (d) Release and remove the guide and driver.
- (10) Using protective gloves, remove a stepped pin (O2/l-390) from the freezing agent and assemble to its location in the underside of the inclined bevel gear bearing housing mounting face using the mechanical driver (Tool 952) (Ref.Fig.502) as follows.

- (a) Assemble the stepped pin to the location pin at the base of the clamp body, ensuring that the tapered head on the stepped pin is directed towards the clamp guide of the mechanical driver.

NOTE: The thrust screw should be sufficiently unscrewed so as to allow the mechanical driver and assembled stepped pin sufficient clearance when positioning the stepped pin in its location.

- (b) Position the mechanical driver on the inclined bevel gear bearing mounting face and locate the locating pin diametrically opposite to the location to which the stepped pin is to be assembled.
- (c) Screw in the thrust screw to draw the clamp body up the guide and the stepped pin into its location. Ensure that the pin is fully inserted.

NOTE: The alignment of the pin to its location in the gearbox case, must be visually checked prior to the operation of the thrust screw.

OVERHAUL

- (d) Release and remove the mechanical driver and repeat sub para.(a), (b) and (c) for the remaining five pins.

NOTE: If a pin has previously been assembled to the location required for the positioning of the locating pin on the mechanical driver, the locating pin should be withdrawn and the mechanical driver located on the protruding stepped pin.

- B. Assemble the Shrink Fit Items to the Gearbox Front Cover, Oil Filter Adapters, Inclined Bevel Gear Drive Bearing Housing, Hydraulic Pump Adapters, Scavenge Pump Case and Flexible Coupling Shaft (Ref.Fig.503).

NOTE: The following procedure is required to be carried out only if the front cover, oil filter adapters, bearing housing, hydraulic pump adapters and scavenge pump case are new items.

- (1) Place the front cover (01/4-90), oil filter adapters (01/2-140) (01/2-330), hydraulic pump adapters main (01/7-60), stand-by (01/7-150), stand-by hydraulic pump adapter assembly (01/7-180), scavenge pump case (01/5-120) and flexible coupling shaft (02/1-40) in a preheated oven controlled at 100 deg C for approx. 30 minutes.

NOTE: The inclined bevel gear drive bearing housing (02/1-320) is not heated.

- (2) Place the items listed in Table 502 into an approved freezing agent (10 to 15 minutes approx. in Cardice or 2 to 3 approx. minutes in liquid nitrogen), the removal time to coincide with the removal of the heated items from the oven.
- (3) On the completion of their heating period, use protective gloves and remove the front cover, oil filter adapters, hydraulic pump adapters, scavenge pump case and flexible coupling shaft from the oven and place on a suitable working surface.
- (4) Using protective gloves, remove the hollow pins, shouldered pins, stepped pins and plug from the freezing agent and assemble to specified locations with appropriate tools, as detailed in Table 502.

OVERHAUL

- (6) Assemble the spacer sleeve (O2/1-50) to the flexible coupling shaft (O2/1-40).
  - (a) Position the support (Tool 709), with the larger bore uppermost, on a suitable base.
  - (b) Pass the smaller diameter splined end of the shaft through the support and locate the flange on the shaft into the recess in the support.
  - (c) Using protective gloves, remove the sleeve from the freezing agent and insert the smaller diameter end into the shaft, then with the driver (Tool 710) located in the sleeve, press in the sleeve until it abuts the step within the shaft.
- C. Assemble the Oil Jets, Bearings and Quick Attach/Detach Coupling to the Front Cover (Ref.Fig.504).
  - (1) Assemble the holding fixture (Tool 430) to a Hydraclamp and secure the fixture with the two captive bolts. Rotate the fixture into a horizontal position.
  - (2) Assemble the front cover to the holding fixture engaging the oil pressure transmitter and oil pressure switch mounting faces with the fixture and secure with 14 captive bolts.
  - (3) Assemble the oil jet (O1/4-360) to the location near the vertical bevel gear drive bearing location and secure with the bolt (O1/4-350). Ensure the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (4) Assemble the outer ring of the roller bearing (O1/4-420) to the starter drive location (inner face). Secure the bearing ring with the retaining ring (O1/4-400) and the three bolts (O1/4-390). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (5) Position the outer ring of roller bearing (O1/4-440) to the vertical bevel gear drive shaft location. Secure with three bolts (O1/4-430). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (6) On engines Pre. SB.72-23 assemble the oil jet (01/4-320) and filter assembly (01/4-340) to the front cover.

- (a) Locate and secure the support (Tool 431) in a bench vice.
- (b) Position the filter assembly into the support and engage the castellations on the filter with those in the support.
- (c) Engage the jet in the filter and screw in using wrench (Tool 456).
- (d) Remove the jet/filter assembly from the support and insert the assembly into the orifice in the oil pump mounting face in the front cover.

- (7) On engines embodying SB.72-23 assemble the plug (01/4-330), into the orifice in the oil pump mounting face in the front cover.

D. Assemble the Oil Pump to the Front Cover (Ref.Fig.504).

- (1) With the front cover holding fixture secured to the Hydraclamp locate the oil pressure transmitter and switch mounting faces on the holding plate and secure the cover to the plate with the 14 captive bolts.
- (2) On engines Pre. SB.72-23 position the two pressure pump spur gears (01/5-160) into the oil pump location in the front cover.
- (3) On engines embodying SB.72-23 position the two gear blanks (01/5-160) into the oil pump location on the front cover.
- (4) Locate the scavenge pump case (01/5-120) on the two pins in the front cover mounting face and assemble to the front cover. Ensure that the pump mounting face is in full contact with the corresponding front cover mounting face.

OVERHAUL

- (5) Position the two scavenge spur gears (01/5-110) into their locations in the scavenge pump case.

NOTE: The driving gear of the scavenge pump rotates counter-clockwise, viewed from above the installed gears. If the gears are the original, ensure that they are assembled in their original attitude as shown by the gear teeth engagement markings.

- (6) Check the end-float with a straight edge and feeler gauges, then check the backlash and radial clearances with feeler gauges (Ref.Fig.505). Take measurement at several positions to obtain mean clearances, then check that the figures obtained are within the limits quoted in (Fits and Clearance Schedule 72-63-00 407, 410 and 408).
- (7) Assemble the scavenge pump cover (01/5-60) to the scavenge pump case, locating it on the two hollow pins.
- (8) Secure the cover and the case to the front cover with eight washers (01/5-20) and bolts (01/5-10). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) and torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (9) Insert the drive shaft (01/5-50) through its location in the scavenge pump cover, scavenge spur gear driver, scavenge pump case, pressure spur gear driver (Pre. SB.72-23) or blank (SB.72-23) and gearbox front cover. Turn the drive shaft to ensure the splines are engaged with the scavenge pump spur gear, and that the scavenge gears have freedom of rotation.
- (10) Assemble the hand turning shaft (01/5-40) to the drive shaft in its location in the gearbox front cover.
- (11) Immobilize the drive shaft with immobilizer (Tool 787).
- (a) Locate the immobilizer on the oil pump drive shaft.

- (b) Position both blocks of the immobilizer on the front cover mounting face and secure the immobilizer to the cover with the two captive bolts.

- (12) Secure the hand turning shaft to the drive shaft and the drive shaft to the oil pump and front cover assembly with the self-locking nut (01/5-30). Ensure the nut has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) then torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m), unscrew the captive bolts and remove the immobilizer.

E. Assemble the Relief Valve Blank to the Front Cover (Ref.Fig.504).

- (1) Insert the blanking plate (01/4-40) into the relief valve location in the front cover, ensuring that the lip on the blanking plate is located in the step in the front cover case.
- (2) Position the retaining sleeve (01/4-30) into the relief valve location and using the wrench (Tool 1477) screw in the sleeve to abut the blanking plate. Torque-tighten the sleeve between 290 and 310 lbf in. (32,8 and 35,0 N.m).
- (3) Assemble the Corruplus seal (01/4-20) to the relief valve cap (01/4-10) and assemble the relief valve cap/Corruplus seal to the front cover. Using adapter (Tool 1587) check the torque loading of the crowfoot wrench (Tool 1579 Pre SB.72-8 or Tool 1972 SB.72-8) for 170 to 190 lbf in. (19,2 and 21,5 N.m) in accordance with 72-09-00 Assembly. Having determined the correct torque figure, use the wrench and torque-tighten the relief valve cap between 170 and 190 lbf in. (19,2 and 21,5 N.m). Wire-lock the cap to the front cover.

OVERHAUL

F. Assemble the Starter QAD Adapter to the Front Cover  
(Ref.Fig.504).

- (1) Assemble the front cover holding fixture (Tool 430) to a Hydraclamp and secure with the two bolts.
- (2) Assemble the front cover to the holding fixture engaging it at the oil pressure transmitter and oil pressure switch mounting faces, secure with the 14 captive bolts.
- (3) Insert the flange (01/3-50) into the coupling ring (01/3-70) and position the flange/coupling ring onto the starter drive location on the front cover, interposing the gasket (01/3-60) between the flange and case faces. Insert the three flanged pins (01/3-40) into their locations in the flange and gearbox case. Retain the gasket, retaining ring, flange and the pins with the 13 bolts (01/3-30). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten to 100 lbf in. (11,5 N.m).
- (4) Position the mounting bracket (01/3-120) on the mounting boss close to the starter drive location and secure it to the case with the two bolts (01/3-110). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Locate the spherical washer (01/3-20) on the locking bolt (01/3-10), then insert the bolt through the mounting bracket and engage the thread in the coupling ring. Temporarily tighten the bolt.
- (6) Release and remove the front cover from the holding fixture (Tool 430).
- (7) Assemble the protector (Tool 778) to the location of the starter QAD coupling and place the front cover into the container (Tool 510).

G. Assemble the Gearbox Case to the Build Stand (Ref.Fig.532).

- (1) Assemble and secure the lifting adapter (Tool 794) to its location on the gearbox case close to the main and stand-by hydraulic pump mounting locations.

OVERHAUL

- (2) Assemble and secure the lifting adapter (Tool 793) to its location on the gearbox case close to the inclined bevel gear drive assembly mounting location.
- (3) Assemble the lifting fixture (Tool 827) to the centre of the top slot in the lifting fixture (Tool 795) and secure the two fixtures together with the captive bolt, washer and nut.
- (4) Attach a hoist to the lifting fixture and position the fixture close to the adapters assembled to the gearbox case. Ensure the lifting plate with the locking pin and fulcrum pin (part of fixture (Tool 795)) is next to the adapter (Tool 793). Unscrew and remove the locking pin then screw both fulcrum pins in to their respective adapters.
- (5) Raise the hoist until the gearbox is supported, then turn the gearbox so that the IDG mounting face is at the bottom. Engage and screw the locking pin through the lifting fixture in to the adapter (Tool 793).
- (6) Raise the hoist and position the IDG mounting face to the build stand (Tool 494) such that on the assembly of the immobilizer (Tool 540) to the triangularly spaced tapped holes in the build stand, the splined shaft of the immobilizer will lie on the centre line of the hydraulic pumps drive shaft in the gearbox case. Locate and secure the gearbox case to the build stand with the 32 captive bolts.
- (7) Release and remove the lifting fixture from the adapters and hoist then release and remove the two adapters from the gearbox.

#### H. Assemble the Oil Jet and Strainer.

- (1) Check the oil jet assembly (01/9-70) thoroughly for cleanliness and freedom from obstruction. Position the jet assembly in the interior of the gearbox case at the location close to the IDG drive shaft bearing location (Ref.Fig.506). Secure the jet to the case with the two bolts (01/9-80). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (2) Check the strainer body (01/9-90) for its run-down torque and sufficient insertion into the strainer housing (01/9-120) located in the interior of the gearbox case (Ref.Fig.506).
    - (a) Position the retainer (Tool 493) on the strainer housing aligning the lugs on the retainer with the castellations on the housing, and the flat on the retainer with the projection on the gearbox case.
    - (b) Insert the strainer body into the housing, and screw in the body until the measurement from the body head to the top of the housing is between 0.260 and 0.300 in. (6,6 and 7,6 mm) (Ref.Fig.506 dimension X). Measure and record the locking (run-down) torque.
    - (c) Unscrew and remove the strainer body from the strainer housing.
  - (3) Check the strainer (01/9-110) for damage and freedom from obstruction, then insert the strainer into the strainer sleeve (01/9-100).
  - (4) Insert the strainer/sleeve into the strainer body (01/9-90) and position the body/strainer/sleeve into the strainer housing.
  - (5) Torque-tighten the strainer body between 50 and 70 lbf in. (5,6 and 7,9 N.m) plus the measured locking torque.
  - (6) Unscrew the retainer captive bolts and remove the retainer from the gearbox case.
  - (7) Assemble the gasket (01/10-25) and cover (01/10-20) to the location on the exterior of the gearbox case near the IDG mounting face. Secure the cover to the case with the five bolts (01/10-18). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- J. Assemble the Pressure Filter and Nut Assembly to the Gearbox Case (Ref.Fig.507 and 507A).
- (1) Locate the restrictor plug (01/2-390) in the valve body assembly (01/2-380) and insert the restrictor

OVERHAUL

plug/valve body assembly into its location in the pressure filter orifice in the gearbox case. Torque-tighten the valve body between 50 and 55 lbf ft (67,8 and 74,6 N.m).

- (2) Assemble a Corruplus seal (Pre SB.72-8312-189) or toroidal sealing ring (SB.72-8312-189) to the filter adapter (01/2-330,340) then, with the stepped pin aligned with its location, assemble the adapter to the pressure filter location in the gearbox case.
- (3) Locate the bracket (01/2-310) on the two stepped pins on the adapter and secure the bracket and adapter to the gearbox case with six bolts (01/2-300). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Assemble the pressure filter.
  - (a) Check the strainer element (01/2-370) for cleanliness and freedom from obstructions.
  - (b) Position the spring (01/2-360) on the cover (01/2-270) and engage the thread on the cover with the thread in the strainer element, screw both units together until the threads disengage, allowing the strainer element to float under the action of the spring, on the cover.
- (5) On engines Pre SB.0L.593-72-9036-419, position the sealing ring (01/2-290) in the oil filter adapter and insert the cover/spring/strainer element into the filter adapter ensuring that slots in the cover engage the lugs on adapter.

**NOTE:** Ensure the Metaflex seal and oil filter adapter are to the same Service Bulletin standard. Metaflex seals to SB.72-7 standard incorporate one and a half loose turns of stainless steel wrapper positioned around the outer circumference. This area is not laminated with asbestos and is not spot welded. Seals of this type must not be mistaken for unserviceable seals which are rejected because of spot weld failure.

OVERHAUL

- (6) On engines to SB.OL.593-72-9036-419, position the sealing rings (02-2900) on the cover and insert the cover/spring/strainer element into the filter adapter ensuring that slots in the cover engage the lugs on adapter.

NOTE: Ensure the Metaflex seal and oil filter adapter are to the same Service Bulletin standard. Metaflex seals to SB.72-7 standard incorporate one and a half loose turns of stainless steel wrapper positioned around the outer circumference. This area is not laminated with asbestos and is not spot welded. Seals of this type must not be mistaken for unserviceable seals which are rejected because of spot weld failure.

- (7) Assemble the nut assembly (01/2-210) to the filter adapter and hold the cover, through the nut, hard against its sealing ring. Engage the threads of the nut then turn clockwise by hand, as far as possible.

CAUTION: ENSURE THAT THREADS HAVE ENGAGED FREELY BEFORE APPLYING TIGHTENING FORCE TO NUT ASSEMBLY.

- (8) Position the spherical washer (01/2-200) on the locking bolt (01/2-190) and insert the bolt through the bracket and engage the spherical nut of the nut assembly. Screw in the bolt and check that the locking (run-down) torque is within 3 to 10 lbf in. (0,3 and 1,1 N.m).

- (9) Ensure the nut assembly is hand tight then torque-tighten the locking bolt to 60 lbf in. (6,8 N.m).

- (10) Finally tighten locking bolt.

(a) Slacken locking bolt, retighten and ensure locking (run-down) torque is still within the limits 3 to 10 lbf in. (0,3 and 1,1 N.m).

(b) Torque-tighten bolt to 60 lbf in. (6,8 N.m).

- (11) On engines Pre SB.0L.593-72-9036-419 only, assemble the Corrujoint seal (01/2-260) to the plug (01/2-250) and locate the seal/plug into its location in the pressure filter cover assembly. Torque-tighten the plug between 230 and 250 lbf in. (26,0 and 28,2 N.m).

**K. Assemble the Scavenge Filter and Nut Assembly to the Gear-box Case (Ref. Fig.507 and 507A).**

- (1) Assemble a Corruplus seal (Pre SB.72-8312-189) or toroidal sealing ring (SB.72-8312-189) to the filter adapter (01/2-140,-50) then, with the stepped pin and its location aligned, assemble the adapter to the scavenge filter location in the gearbox case.
- (2) Locate the bracket (01/2-120) on the two stepped pins in the adapter and secure the bracket and adapter to the gearbox case with six bolts (01/2-110). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the scavenge filter.
  - (a) Check the filter assembly (01/2-180) for cleanliness and freedom from obstructions.
  - (b) Position the spring (01/2-170) on the drain valve and body assembly (01/2-90). Engage the thread on the filter with the thread on the drain valve body. Screw both units together until the threads disengage, allowing the filter to float under the action of the spring on the drain valve body.
- (4) On engines Pre SB.0L.593-72-9036-419, assemble the sealing ring (01/2-100) to the oil filter adapter and insert the drain valve body/spring/filter assembly into the scavenge filter location in the gearbox case ensuring that the slots in the drain valve flange engage the lugs on the adapter.

**NOTE:** Ensure the Metaflex seal and oil filter adapter are to the same Service Bulletin standard.

## L. Oil Flow Check of the Skeleton Gearbox Case (Ref.Fig.508).

- (1) Rotate the case in the build stand until the gearbox front cover mounting face is uppermost.
- (2) Ensure the presence of the sealing ring in the inlet connection on the adapter (Tool 644) and the presence of the flow restrictor and the sealing ring in the outlet connection on the adapter.
- (3) Assemble the flow test adapter to the gearbox front cover mounting face, ensuring that the adapter locates correctly on the two hollow pins. Secure the adapter to the case with the four captive bolts and washers.
- (4) Assemble the flow check blank adapter (Tool 997) to the location of the IDG shaft support bearing.
  - (a) Unscrew the captive nut on the blank to disassemble the adapter.
  - (b) Assemble the seal/blank, with its captive bolt uppermost, from beneath the gearbox case to the IDG shaft support bearing location, ensuring it is located on the two pins.
  - (c) Assemble the seal/blank, with its captive nut, from above to the bearing location and secure both blanks together with the nut.
- (5) Assemble the supply line from the oil rig (Tool 1926) to the flow test adapter and the return line to the outlet adapter. Temporarily tighten the supply and return line union nuts.
- (6) Circulate oil through the gearbox and ensure the presence of an oil flow from the following.

ITEM	LOCATION
Oil jet (01/9-70)	Close to the IDG shaft support bearing
Strainer body (01/9-90)	Interior of gearbox case at the strainer housing

Oil Flow Check  
Table 503 (Continued)

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

ITEM	LOCATION
Oilway	Inclined bevel gear drive mounting face
Oilway	The bore of the main hydraulic pump drive
Hollow pin (01/9-20)	Stand-by hydraulic pump adapter assembly mounting face

Oil Flow Check  
Table 503 (Concluded)

- (7) Release and remove the supply and return lines from the flow test adapter.
- (8) Release and remove the flow test adapter from the gearbox case.
- (9) Release and remove the flow check blank from the location of the IDG shaft support bearing mounting face.
- (10) Place the flow test adapter into the container (Tool 727).

M. Assemble the Bearings and the Inclined Bevel Gear Drive Segment Assemblies to the Gearbox Case (Ref.Fig.506).

- (1) On engines Pre. SB.72-4 assemble the outer ring of the flanged roller bearing (04/1-170) to the rear location of the scavenge oil pump drive in the gearbox case as viewed from the front cover mounting face.
- (2) Assemble the outer ring and rollers of the flanged roller bearing (04/1-160) to the front location of the scavenge oil pump drive in the gearbox case.
- (3) Secure the two bearings to the gearbox case with the three bolts (04/1-150) (inserted from the bottom to top), and nuts (04/1-130). Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SUB-ASSEMBLY

OVERHAUL

- (4) On engine embodying SB.72-4 assemble the common outer bearing ring (04/1-160) and rollers to the rear location of the scavenge oil pump drive (insert from bottom to top) as viewed from the front cover mounting face (Ref.Fig.512).
- (5) Locate the plate washer (04/1-140) to front bearing location of the pump drive and secure outer ring and washer with bolts (04/1-150) and self-locking nuts (04/1-130). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Assemble the outer race of the flanged roller bearing (05/1-110) to the underside of the main hydraulic pump mounting face. Secure the bearing to the case with the four bolts (05/1-100). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Assemble the outer ring of the flanged roller bearing (04/1-100) to the upper of the two locations of the idler gear shaft drive.
- (a) Insert the bearing outer race through the bottom of its location as viewed from the front cover mounting face.
- (b) Secure the bearing outer ring to the gearbox case with the three bolts (04/1-90) (inserted from the bottom), flat washers (04/1-80) and nuts (04/1-70). Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Assemble the outer ring and rollers of the roller bearing (04/1-50) in the lower of the two locations of the idler gear shaft drive. Secure with the three bolts (04/1-40) inserted through the outer bearing ring and the gearbox case (top to bottom as viewed from front cover location), washers (04/1-30) and nuts (04/1-20). Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SUB-ASSEMBLY

**72-63-00**

Page 529

MK.610-14-28  
OVERHAUL

- (9) Assemble the flanged ball bearing (03/1-190) to the rear of the IDG mounting face, as viewed from the front cover mounting face. Insert the two Dee headed bolts (03/1-180) through the bearing housing and the gearbox case at the locations each side of the oilway as viewed from the IDG mounting face. Insert the 10 (shorter) Dee headed bolts (03/1-170) through the other 10 locations in the bearing housing and the gearbox case. Secure the 12 Dee headed bolts to the case with 12 retaining rings (03/1-160) assembling the rings to the grooves in the shanks of the Dee headed bolts with the guide sleeve (Tool 513). Ensure that the retaining rings seat correctly in their location grooves.

NOTE: The flats on the Dee headed bolts must locate to the step on the flanged ball bearing housing.

- (10) Assemble the three segment assemblies (02/1-330) to the stepped pins on the underside of the inclined bevel gear drive bearing housing mounting face. Secure each segment to its location by inserting a bolt (02/1-340) through each of the three sleeves (02/1-370), in the bearing housing mounting face, and engaging the threaded inserts in the segments. Ensure the bolts have a minimum locking (run-down) torque of 2 lbf in. (0,23 N.m) torque-tighten between 36 and 40 lbf in. (4,1 and 4,5 N.m).
- N. Determining the Adjusting Washers for the Bevel Gear Bearing Housings (Ref.Fig.509).
- (1) Position the flanged roller bearing (02/1-430) on a surface table. Assemble the ball bearing (02/1-500) into the bearing housing (02/1-510) and position the bearing housing/ball bearing on to the top of the roller bearing, ensuring full contact between bearing faces by applying a light pressure. Using suitable measuring gauges, determine the dimension between the flange on the bearing housing and the flange on the roller bearing outer ring, record as dimension 'C'. Using this dimension select the required adjusting plate for the vertical bevel gear drive bearing housing from the range of adjusting plates (02/1-440) (Ref.72-09-21 Repair, Fig.440). On completion, identify the adjusting plate, the two bearings and bearing housing and retain them for use in a later assembly procedure.

- (2) Insert the roller bearing (02/1-300) into the bearing housing (02/1-320) using the support (Tool 500) and driver (Tool 501).
- (3) Insert the inner washer (02/1-280) and the outer washer (02/1-290) into the bearing housing.
- (4) Insert the ball bearing (02/1-270) into the bearing housing ensure that the faces of both bearings and washers are in contact with each other.
- (5) Place the housing and installed bearings on to a surface table and by using suitable measuring gauges determine the dimension between the end face of the ball bearing and the housing, record as dimension 'A'.
- (6) Place the flanged roller bearing (02/1-90) on a surface table and by using suitable gauges determine the dimension between the flange on the roller bearing and its end face, record as dimension 'B'.
- (7) The adjusting washer for the inclined bevel gear drive bearing housing =  $(\text{Dim. A} - \text{Dim. B}) - 0.002 \text{ in.}$  (0,050 mm). Select the adjusting washer from the range (02/1-180) (Ref.72-09-21 Repair, Fig.439).
- (8) Position the selected adjusting washer into the bearing housing and using suitable measuring gauges determine the dimension from the lip of the bearing housing to the face of the adjusting washer, record as dimension 'Y'.
- (9) The end-float on the flanged roller bearing =  $(\text{Dim. Y} - \text{Dim. B})$ . The desired amount of end-float is between 0.001 and 0.003 in. (0,025 and 0,075 mm).
- (10) Using the driver (Tool 502) and support (Tool 500) assemble the flanged roller bearing to the bearing housing. Secure the flanged roller bearing, adjusting washer, ball bearing, inner and outer washers and roller bearing in the bearing housing with the three Dee headed bolts (02/1-80) and nuts (02/1-70), ensure that the flats on the boltheads locate to the step of the flanged roller bearing. Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

- P. Determine the Adjusting Washers for the Bevel Gears  
(Ref.Fig.510).

NOTE: The following procedure is required only if new bevel gears, ball bearings or driving shaft are fitted, or if the thickness of the adjusting washers are in doubt.

- (1) Assemble checking gauge (Tool 37) to vertical bevel gear drive shaft location in the gearbox case.
  - (a) Unscrew and remove the (small) hand nut (Tool 498) from the gauge. Insert the end of the gauge sleeve through the bearing housing assembly previously assembled (Ref.para.N.(1)) abutting the step on the gauge sleeve with the inner ring of the ball bearing. Retain the assembled items with hand nut (Tool 498).
  - (b) Assemble the gauge and bearing assembly to the gearbox case at the location of the vertical bevel gear drive shaft. Temporarily retain the gauge and bearing assembly in the gearbox case with the three bolts (02/1-410) lightly tightened.
  - (c) Assemble the front cover fixture (Tool 3077) to the front cover mounting face of the gearbox case, locating it on the checking gauge and the two hollow pins. Secure the fixture to the gearbox case with three captive bolts. Secure the checking gauge to the fixture with the hand nut (Tool 495).
- (2) Assemble the checking gauge (Tool 38) to the inclined bevel gear drive shaft location in the gearbox case.
  - (a) Position the bearing housing (02/1-320), with its previously assembled bearings and washers (Ref.Para.N.(10)), on the gauge, abutting the step on the gauge with the inner roller bearing ring. Secure the assembly to the gauge with the spacer ring (Tool 496) and hand nut (Tool 497).

- (b) Assemble the complete bearing and gauge assembly to the gearbox case at the location of the inclined bevel gear drive shaft mounting face, temporarily retain with six equispaced bolts (02/1-10), lightly tightened.
- (3) Carry out checking gauge checks.
- (a) Insert the probe of the inclined bevel gear drive checking gauge (Tool 38) so that it abuts the outside diameter of the vertical bevel gear drive checking gauge (Tool 37).
- (b) Insert the slip gauges and determine the dimension between the end of the inclined bevel gear drive checking gauge probe and the gauge body. Record the dimension 'Y'.
- (c) Rotate the vertical bevel gear drive checking gauge until the hole in its body is aligned with the probe of the inclined bevel gear drive checking gauge.
- (d) Insert the probe of the inclined bevel gear drive checking gauge in the hole so that it abuts the smaller diameter of the probe of the vertical bevel gear drive checking gauge.
- (e) Withdraw the probe on the vertical bevel gear drive checking gauge, insert slip gauges and determine the dimension between the end of the vertical bevel gear drive gauge probe and the gauge body. Record the dimension 'X'.
- (4) Remove the inclined bevel gear drive checking gauge.
- (a) Unscrew and remove the six bolts retaining the checking gauge and the inclined bevel gear drive bearing housing to the gearbox case. Remove the assembly from the gearbox case.
- (b) Unscrew and remove the hand nut and spacer ring from the gauge and the gauge from the bearing assembly. Protect the bearing assembly for a later assembly procedure.

OVERHAUL

- (5) Remove the vertical bevel gear drive checking gauge.
  - (a) Unscrew and remove the hand nut (Tool 495) from the checking gauge.
  - (b) Unscrew the three captive bolts retaining the front cover fixture to the gearbox case, remove the fixture from the case.
  - (c) Unscrew and remove the three bolts securing the gauge and bearing assembly to the gearbox case, remove the gauge and bearing assembly from the case.
  - (d) Unscrew the hand nut (Tool 498) from the checking gauge and remove the checking gauge from the bearing assembly. Protect the bearing assembly for a later assembly procedure.
- (6) Replace all the checking gauges, hand nuts and the front cover fixture into the container (Tool 499).
- (7) Calculate the thickness of the vertical bevel gear drive adjusting washer.
  - (a) Examine the vertical bevel gear wheel and note the (actual) mounting distance (MD), as etched on the bevel gear wheel.
  - (b) Adjusting washer thickness required for vertical bevel gear drive = Dimension 'X' + 3.060 in. - MD, where 3.060 in. is the theoretical MD.
- (8) Select the calculated adjusting washer for the vertical bevel gear drive from the range of adjusting washers (02/1-520) (Ref.72-09-21 Repair, Fig.441) and place with the appropriate bearing assembly.
- (9) Calculate the thickness of the inclined bevel gear drive adjusting washer.
  - (a) Examine the inclined bevel gear wheel and note the (actual) mounting distance MD), as etched on the bevel gear wheel.
  - (b) Adjusting washer thickness required for inclined bevel gear drive = Dimension 'Y' + 2.700 in. - MD, where 2.700 in. is the theoretical MD.

OVERHAUL

Calculating the Working Length of the Sealol Seal  
Figure 511

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (10) Select the calculated adjusting washer for the inclined bevel gear drive from the range of adjusting washers (02/1-100) (Ref. 72-09-21 Repair, Fig.438) and place with appropriate bearing assembly.

- Q. Assemble the Sealol Seal to the Stand-by Hydraulic Pump Adapter for Working Length Checks (Fig.511).

NOTE: It is essential that care is taken during assembly of the Sealol seal and its mating parts to avoid damage or distortion. The seal and mating ring are a matched set, and must be assembled at the same location.

- (1) Ensure that the following mating faces are free from burrs, surface damage and distortion likely to prevent proper seating of the Sealol seal:

- (a) flanged ball bearing (05/1-90) with seal mating ring (05/1-170).
- (b) seal mating ring with seal sleeve (05/1-160).
- (c) Sealol seal (05/1-150) with adapter (01/7-150).

Raised surface damage (including part number marking) may be lightly stoned down (Ref. 72-09-22 Repair).

- (2) Assemble the flanged ball bearing (05/1-190) to its location in the rear of the stand-by pump adapter assembly (01/7-180), then secure it with three bolts (05/1-180). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Position the adapter assembly/ball bearing on the support (Tool 483) with the bearing uppermost, then using the driver (Tool 490), press the spur gear shaft (05/1-200) into the bearing until the step on the shaft contacts the inner ring of the bearing.

SUB-ASSEMBLY

**72-63-00**

Page 538

Dec 1/88

OLYMPUS 593

MK.610-14-28

OVERHAUL

**NOTE:** The shank distance between the step and spur gear is greater on the stand-by hydraulic pump side.

- (4) Support the inner ring and rollers of the flanged roller bearing (05/1-110) on the support (Tool 483), then using the driver (Tool 490), press the spur gear shaft, main hydraulic pump end, into the bearing inner ring until the step on the shaft contacts the ring.
- (5) Check that the seal mating ring (05/1-170) and sleeve seal (05/1-160) are bedding satisfactorily by trial assembly using engineers blue.
- (6) Assemble the seal mating ring with its chamfered side toward the spur gear, sleeve seal, keywasher (05/1-140) and nut (05/1-130) to the spur gear shaft located in the stand-by hydraulic pump adapter assembly. Using the holder (Tool 512) and wrench (Tool 1525) temporarily tighten the nut.
- (7) Calculate the working length of the Sealol seal.
  - (a) Using suitable gauges measure the distance of the mating ring from the grooved face of the adapter assembly. Care must be taken not to scratch the ring. Record as dimension 'A'.
  - (b) Place the stand-by hydraulic pump adapter (01/7-150) on a surface table. Using suitable gauges measure, and record, the dimensions 'X' and 'Y'.
  - (c) Working length of Sealol seal = Dimension 'A' - Dimension 'X' + Dimension 'Y'. The desired working length is between 0.530 and 0.590 in. (13,46 and 14,98 mm).

**NOTE:** If the desired working length is not achieved the items which effect the seals working length must be renewed e.g. stand-by hydraulic pump adapter assembly, seal mating ring or adapter.

OVERHAUL

- (8) Using the holder (Tool 512) and wrench (Tool 1525) unscrew and remove the nut, keywasher, the sleeve seal and the mating ring from the spur gear shaft.
  - (9) Lap the Sealol seal and mating ring (Ref.72-09-00 Inspection/Check).
  - (10) Assemble the seal mating ring on the spur gear shaft with its chamfered side toward the spur gear. Assemble the sleeve seal on the spur gear shaft.
  - (11) Assemble the adapter (01/7-150) face, with stepped pin, to the smaller diameter of the support (Tool 503).
  - (12) Lubricate the outside diameter of the Sealol seal (05/1-150) with lubricant A, position the seal with its carbon face uppermost in the adapter and using the driver (Tool 504) press in the seal. Ensure that the seal is squarely inserted and fully seated in the adapter. Lubricate the carbon seal face with lubricant A.
- R. Assemble the Gearshaft and Sealol Seal Assembly to the Stand-by Hydraulic Pump Adapter Assembly.
- (1) Assemble the Corruplus seal (01/7-160) to the groove in the stand-by adapter assembly (01/7-180).
  - (2) Assemble the adapter (01/7-150) to the adapter assembly (01/7-180) ensuring that the orifice in the adapter is aligned with the corresponding stepped pin in the adapter assembly. Abut the mounting face of the adapter with that of the adapter assembly and secure with seventeen bolts (01/7-140). Ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (3) Assemble the retaining ring (05/1-120) to the nut (05/1-130) then locate the keywasher (05/1-140) and the nut on the spur gear shaft.

- (4) Torque-tighten the nut on the spur gear shaft, using the vice holder (Tool 512) and the wrench (Tool 1525).
- (a) Assemble the vice holder into a bench vice.
- (b) Locating the splines on the holder with the splines on the interior circumference of the shaft, position the shaft and its assembled items into the holder.
- (c) Position the wrench (Tool 1525) on the nut and torque-tighten to 190 lbf ft (258,0 N.m).

NOTE: Do not peen the keywasher at this stage in the gearbox assembly.

S. Assemble the Oil Pump Drive and Idler Gears to the Gearbox Case (Ref.Fig.512 and 513).

- (1) On engines Pre. SB.72-4 assemble the inner ring and rollers of the flanged roller bearing (O4/l-170) and on engines embodying SB.72-4 assemble the inner ring and rollers of the flanged roller bearing (O4/l-160B) to the oil pump spur gear drive (O4/l-190).
- (a) Position the spur gear on the support (Tool 672).
- (b) Using the driver (Tool 671), press the inner ring and rollers of the bearing onto the spur gear, ensuring the inner ring is abutting the step on the spur gear.
- (2) Using the support (Tool 672) and driver (Tool 671), assemble the spacer sleeve (O4/l-180) to the spur gear.
- (3) Using the support (Tool 672) and driver (Tool 671), on engines Pre. SB.72-4 assemble the inner ring of the flanged roller bearing (O4/l-160) and on engines embodying SB.72-4 the inner ring of bearing (O4/l-160B) to the spur gear.

NOTE: Do not assemble the side plate, part of the bearing inner ring, at this stage.

- (4) Assemble the spur gear and assembled inner bearing rings to their location in the gearbox case.

SUB-ASSEMBLY

MK.610-14-28

OVERHAUL

- (5) Assemble the side plate to the roller bearing and secure the spur gear to the gearbox case with the self-locking nut (04/1-120) ensuring that the self-locking fixture of the nut is elliptical and not four lobed (Ref.SB.72-105). Tighten the nut using the immobilizer (Tool 652) and the wrench (Tool 651).
- (a) Engage the lugs on the immobilizer with the corresponding castellations on the nut and secure the immobilizer, with the two captive bolts, to the front cover mounting face.
  - (b) Pass the wrench through the immobilizer and engage the splines in the spur gear with the wrench.
  - (c) Turn the wrench and the spur gear to tighten the self-locking nut. Ensure the nut has a locking (run-down) torque of between 6 and 23 lbf ft (8,1 and 67,8 N.m), then torque-tighten it to 60 lbf ft (81,3 N.m) plus the measured locking (run-down) torque figure.
  - (d) Unscrew and release the captive bolts and remove the immobilizer and the wrench.
- (6) Assemble the inner ring and rollers of the bearing (04/1-100) to the idler shaft (04/1-110).
- (a) Position the inner ring in the support (Tool 529).
  - (b) Locate the driver (Tool 530) in the idler shaft, and press the idler shaft into the bearing inner ring. Ensure that the inner ring abuts the step on the idler shaft.
  - (c) Remove the driver and the support.
- (7) Locate the inner ring of roller bearing (04/1-50) into its outer ring in the gearbox case.
- NOTE: The side plate of the bearing (04/1-50) must not be fitted at this stage in the procedure.
- (8) Support the idler gear assembly (04/1-60) so that its centre line lies on the centre line of the two roller bearings within the gearbox case. Ensure the teeth of the idler gear are meshed with the teeth of the oil pump spur gear.

- (9) Using the mechanical puller (Tool 541) (Ref.Fig.513), insert the idler shaft through the roller bearing (04/1-100), gear (04/1-60) and roller bearing (04/1-50).
- (a) Support the thrust nut in the location normally occupied by the side plate in the bearing (04/1-50), as viewed through the mounting location of the IDG assembly in the gearbox case.
- (b) Locate the captive plate to the thrust nut and to one of the IDG support bearing housing securing bolts, retain the plate to the bolt with a slave nut.
- (c) Insert the thrust screw through the idler shaft, as viewed from the front cover mounting face. Engage the thread of the thrust screw in the thrust nut, operate the thrust screw until the step on the race holder is inserted into the end of the idler shaft.
- (d) Ensure the splines on the idler shaft engage the splines in the idler gear, then screw in the thrust screw pressing the idler shaft into its location.
- (e) Unscrew and remove the puller, thrust screw and captive plate.
- (10) Assemble the side plate to the roller bearing (04/1-50).
- (11) Secure the gear and shaft into the bearing assemblies with the self-locking nut (04/1-10) ensuring that the self-locking fixture of the nut is elliptical and not four lobed (Ref.SB.72-105) (Ref.Fig.514).
- (a) Engage and screw the nut (04/1-10) onto the shaft. Locate the lugs on the immobilizer (Tool 642) with the corresponding castellation in the nut and the holes in the captive plate with four of the IDG support bearing housing securing Dee headed bolts and the headless pin. Secure the holder with four slave nuts.
- (b) Locate the spigot of the wrench (Tool 643) in the bore of the idler shaft and engage the three equi-spaced lugs on the wrench into the cutaways in the shaft.

- (c) Turning the idler shaft with the wrench, torque-tighten the self-locking nut. Ensure that the nut has a locking (run-down) torque of between 7 and 28 lbf ft (9,0 and 38,4 N.m), then torque-tighten it to 80 lbf ft (108,5 N.m) plus the measured locking torque figure then remove the wrench and the immobilizer.
- T. Assemble the Stand-by Hydraulic Pump Adapter Assembly and Main Hydraulic Pump Adapter to the Gearbox Case to Check the Sealol Seal Adjusting Washer Size (Ref.Fig.515).
- NOTE:** It is essential that care is taken during assembly of the Sealol seal and its mating parts to avoid damage or distortion. The seal and mating ring are a matched set, and must be assembled at the same location.
- (1) Ensure that the following mating faces are free from burrs, surface damage and distortion likely to prevent proper seating of the Sealol seal:
- (a) flanged roller bearing (05/1-110) with seal mating ring (05/1-90).
  - (b) seal mating ring with sleeve seal (05/1-80).
  - (c) Sealol seal (05/1-70) with adapter (01/7-60).
- Raised surface damage (including part number marking) may be lightly stoned down (Ref.72-09-22 Repair).
- (2) Assemble the gasket (01/7-320) to the stand-by hydraulic pump adapter assembly location on the gearbox case. Locate the adapter assembly on the hollow pin in its mounting face and engage the teeth of the hydraulic pumps spur gear with those of the oil pump idler gear.
- (3) Position the gasket (01/7-290), drain elbow (01/7-280) and bracket (01/7-270) to their locations on the stand-by adapter assembly.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Secure the drain elbow, bracket, adapter assembly and gasket to the gearbox case with the 26 bolts (01/7-190) and 24 washers (01/7-200). Locate two of the bolts through the drain elbow, and 24 bolts and washers to the remaining locations. Ensure the 26 bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) torque-tighten between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (5) Check that the seal mating ring (05/1-90) and the sleeve seal (05/1-80) are bedding satisfactorily by trial assembly using engineers blue.
- (6) Assemble the seal mating ring with its chamfered side toward the spur gear, sleeve seal, keywasher (05/1-30) and nut (05/1-20) on the spur gear shaft at the main hydraulic pump location. Using the immobilizer (Tool 540), wrench (Tool 1525), temporarily tighten the nut.
  - (a) Insert the splined shaft of the immobilizer in the spur gear shaft and engage the splines. Locate the three triangularly spaced holes in the plate with the corresponding tapped holes in the build stand (Tool 494). Retain the immobilizer to the build stand with the three captive bolts.
  - (b) Temporarily tighten the nut on the spur gear shaft, main hydraulic pump end, using the wrench (Tool 1525).

NOTE: Do not peen the keywasher at this stage.

- (7) Calculate the Sealol seal adjusting washer (Ref. Fig.516).
  - (a) Using suitable gauges measure the distance of the mating ring face below the surface of the gearbox case. Care must be taken not to scratch the ring. Record as dimension 'C'.
  - (b) Place the main hydraulic pump adapter (01/7-60) on a surface table and using suitable gauges measure and record the dimensions 'W' and 'Z'.

- (c) Length of Sealol seal adjusting washer =  
Dimension 'C' - Dimension 'W' + Dimension 'Z' -  
0.550 in. (13,97 mm).
- (d) Select the calculated adjusting washer from the  
range of adjusting washers (05/1-40) (Ref.72-09-21  
Repair, Fig.442).
- (8) Using the immobiliser (Tool 540) and wrench (Tool  
1525), unscrew and remove the nut, keywasher, sleeve  
seal and mating ring from the spur gear shaft.
- (9) Lap the Sealol seal and mating ring (Ref.72-09-00  
Inspection/Check).
- (10) Assemble the seal mating ring on the spur gear shaft  
with its chamfered side toward the spur gear.  
Assemble the sleeve seal on the spur gear shaft.
- (11) Using the support (Tool 503) and the driver (Tool 504),  
assemble the selected adjusting washer and the Sealol  
seal (05/1-70) in the main hydraulic pump adapter.
  - (a) Assemble the adapter to the support, locating  
the stepped pin on the adapter with the slot in  
the support.
  - (b) Position the adjusting washer (05/1-40) in the  
adapter. Lubricate the outside diameter of the  
Sealol seal (05/1-70) with lubricant A then  
position the seal with its carbon face upper-  
most in the adapter. Using the driver (Tool  
504) press seal and washer into the adapter  
until they abut the step in the adapter.
  - (c) Ensure that the seal is squarely and fully  
seated in the adapter.
  - (d) Remove the driver and the support.
  - (e) Lubricate the carbon seal face with lubricant A.
- (12) Locate the Corruplus seal (01/7-90) in the groove in  
the mounting face of the main hydraulic pump adapter.

- (13) Locate the adapter, and assembled items, on the two stepped pins in the gearbox case, with the pin in its uppermost face toward the front cover mounting face.
- (14) Position the receptacle (01/7-30) on the bracket (01/7-100) and retain with the four screws (01/7-20) and nuts (01/7-10).
- (15) Position the bracket and receptacle on the main hydraulic pump adapter mounting flange and retain the adapter to the gearbox case with the 16 bolts (01/7-70). Using the cranked wrench (Tool 645) ensure the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0.4 N.m) torque-tighten between 67--and 73 lbf in. (7.6 and 8.2 N.m).
- (16) Assemble the retaining ring (05/1-10) to the nut (05/1-20), locate the keywasher (05/1-30) and nut onto the spur gear shaft then using the wrench (Tool 1525) torque-tighten the nut to 190 lbf ft (258.0 N.m).
- (17) Unscrew the three captive bolts on the immobilizer, remove the immobilizer wrench and guide from the build assembly.
- (18) Using the peening tool (Tool 666), adapter (Tool 667) and peening fixture (Tool 233), peen the keywashers on each end of the spur gear shaft (Ref.Fig.517).
  - (a) Locate the spigot of the peening tool (Tool 666) into the bore of the spur gear shaft and locate the sprung rectangular locator into one of the ten equi-spaced detents around the circumference of the nut.
  - (b) Position and support the adapter (Tool 667) onto the nut, at the opposite end of the spur gear shaft to the keywasher being peened.
  - (c) Position the peening fixture relative to the main and stand-by hydraulic pump adapters.

MK.610-14-28

OVERHAUL

- (d) Engage the adapter into the peening fixture, then screw in the thrust screw until the locating bush engages the peening tool and slight resistance is felt. Continue to screw in the thrust screw for approximately two and one half turns.
- (e) Unscrew the thrust screw and remove the fixture, peening tool and adapter from the gearbox.
- (f) Repeat operation (18)(a) to (18)(e), for the key-washer at the opposite end to the one peened.

OVERHAUL

U. Assemble the Vertical Bevel Gear, Driving Spur Gear Assemblies to the Gearbox Case.

- (1) Using the support (Tool 533) and driver (Tool 534), assemble the bevel gear to the driving spur gear.
  - (a) Position the bevel gear (02/1-610), teeth uppermost, over the smaller bore in the support.
  - (b) Insert the splined end of the spur gear shaft (02/1-640) into the bevel gear. With the wrench access holes in spur and bevel gear aligned, engage the splines.
  - (c) Assemble the driver to the shaft and press the shaft into the bevel gear, ensure contact between the bevel gear and the lip on the spur gear shaft.
- (2) Assemble the bearing inner ring and rollers (02/1-630) on the vertical bevel gear and drive shaft.
  - (a) Position the bearing inner ring in the larger bore of the support (Tool 533).
  - (b) Insert the spur gear end of the shaft (02/1-640) in the inner ring and using the driver (Tool 534) press in the shaft until the lip, on the shaft, and the ring are in contact with each other.
- (3) Secure the bearing to the shaft with the nut (02/1-620) ensuring that the self-locking fixture of the nut is elliptical and not four lobed (Ref.SB. 72-105).
  - (a) Position the holder (Tool 646) into a bench vice. Locating the pin in the holder with one of the three access holes in the bevel gear wheel, position the vertical bevel gear drive shaft into the holder.
  - (b) Locate the lugs on the wrench (Tool 647) with the corresponding castellations in the nut.
  - (c) Ensure the nut has a locking (run-down) torque of between 80 and 445 lbf in. (9 and 50,3 N.m) and torque-tighten to 1440 lbf in. (163 N.m) plus the measured rundown torque figure.

OVERHAUL

- (d) Remove the holder and the wrench.
- (4) Assemble the selected adjusting washer (02-1/520) onto the spur gear shaft, bevel gear end.
- (5) Using the driver (Tool 534) and support (Tool 533), assemble the bearing housing (02/1-510) ball bearing (02/1-500) and the inner ring and rollers of the flanged roller bearing (02/1-430) to the spur gear shaft, bevel gear end.
- (a) Locate the housing with assembled bearings in the larger bore of the support, ball bearing uppermost.
- (b) Insert the spur gear shaft into the bearing and using the driver (Tool 534) press in the shaft until the bevel gear, adjusting washer and bearings contact each other.
- (6) Secure the bearings, housing and adjusting washer to the vertical bevel gear drive shaft with the nut (02/1-420) ensuring that the self-locking fixture of the nut is elliptical and not four lobed (Ref.SB. 72-105) (Ref.Fig.518).
- (a) Position the holder (Tool 658) in a bench vice.
- (b) Position the driving spur gear as assembled to the vertical bevel gear drive shaft, into the holder, locating the pin on the holder through one of the three access holes in the driving spur gear.
- (c) Retain the gear to the holder with the two clamp plates, locked with their respective thumbnuts.
- (d) Locate the ten lugs on the wrench (Tool 657) with the corresponding castellations on the nut.
- (e) Ensure the nut has a rundown torque of between 100 and 410 lbf in. (11,3 and 46,3 N.m) and torque-tighten it to 1560 lbf in. (176 N.m) plus the measured run-down torque figure.
- (f) Release and remove the wrench and holder.
- (7) Assemble the outer ring of roller bearing (02/1-430) and the selected adjusting plate (02/1-440) to the gearbox case at the location of the vertical bevel gear drive.

OVERHAUL

- (8) Assemble the vertical bevel gear drive and the bearing assemblies into the adjusting washer and the outer ring, as assembled to the gearbox case. Secure all the assembled items with the three bolts (02/1-410). Ensure the bolts have a minimum locking torque of 3.5 lbf in. (0,4 N.m) and torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**NOTE:** Access to the bolts is gained through the aligned holes in the bevel and driving spur gears.

- (9) Position the immobilizer (Tool 965) on the vertical bevel gear drive shaft, locating the two jaws of the immobilizer with the oil transfer tube and the vertical bevel gear drive shaft, lock the two jaws together by locating the captive 'C' washer on the stud and lightly tightening the nut (Ref.Fig.519).
- (10) Using the support (Tool 648) and driver (Tool 649), assemble the inner ring of the flanged roller bearing (03/1-260) to the starter and IDG spur gear drive assembly (03/1-240).
- (a) Position the inner roller bearing ring into the support.
- (b) Locate the spur gear drive assembly (large spur gear wheel end) into the inner bearing ring and using the driver press the gear drive assembly into the inner ring. Ensure that the inner ring face abuts the step on the gear drive assembly.
- (11) Secure the bearing inner ring to the spur gear drive assembly with the keywasher (03/1-230) and nut (03/1-220), torque-tighten the nut with the wrench (Tool 653) and holder (Tool 654).
- (a) Position the holder into a bench vice.
- (b) Ensuring the correct engagement of the splines on the holder with the splines on the internal circumference of the drive assembly, locate the spur gear drive assembly (opposite end to that of the nut to be tightened) onto the holder.
- (c) Locate the lugs on the wrench with the corresponding castellations on the nut. Torque-tighten the nut to 130 lbf ft (176,0 N.m).

OVERHAUL

- (d) Remove the wrench and holder.
- (e) Peen the keywasher into the nut at three locations, using a suitable radiused punch. If the keywasher has been peened previously, peening must be at least twice the width of one nut slot away.

V. Assemble the Inclined Bevel Gear Assembly to the Gearbox Case.

- (1) Assemble the inner ring of the flanged roller bearing (02/1-90), selected adjusting washer (02/1-100) and bearing housing assembly with its previously assembled items, (Ref. para.N.(10)) onto the inclined bevel gear (02/1-60) using the support (Tool 531) and the driver (Tool 532).
  - (a) With the teeth of the bevel gear located over the step in the support face position the gear on the support.
  - (b) Assemble the bearing inner ring and adjusting washer to the bevel gear shaft.
  - (c) Assemble the bearing housing to the bevel gear shaft as shown in Fig.520.
  - (d) Locate the driver on the inner ring of the roller bearing and press the assembly onto the shaft until the inner ring of the bearing abuts the step in the shaft.
- (2) Retain the inner bearing ring, adjusting washer and bevel gear to the bearing housing assembly with the slave nut (Tool 728).
  - (a) Position the immobilizer (Tool 536) in a bench vice.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Position the bevel gear assembly into the immobilizer locating the bevel gear teeth with the teeth in the immobilizer and the three studs on the immobilizer with the corresponding holes in the bearing housing assembly. Retain the bearing housing assembly to the three studs with the three nuts (Tool 537).
- (c) Locate the lugs of the wrench (Tool 535) with the corresponding castellations in the slave nut and torque-tighten it to 170 lbf ft (230,5 N.m).
- (d) Unscrew the three nuts and remove the wrench and immobilizer.
- (3) Apply marking blue to the inclined bevel gear teeth.
- (4) Assemble the bearing housing/bevel gear assembly to the gearbox case at the inclined bevel gear drive location.
  - (a) On engines to SB.72-8689-272 standard, assemble a slave gasket (02/1A-310) to the bearing housing.
  - (b) Locate the assembly in the gearbox and engage the bearing housing headless pin with its location in the gearbox case.
- (5) Retain the bearing housing assembly to the gearbox case with six bolts (02/1-10) equi-spaced around the bearing housing assembly circumference. Lightly tighten the bolts.
- (6) Temporarily assemble the front cover to the gearbox.
  - (a) Assemble the three locating pins (Tools 526, 527 and 528) to the hollow pin locations in the gearbox front cover mounting face (Ref.Fig.530).
  - (b) Locate and screw the two captive bolts of the lifting fixture (Tool 1867) into the extraction holes in the front cover.

SUB-ASSEMBLY

72-63-00

Page 558

Sep 1/84

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (c) Attach a hoist to the fixture then raise and position the front cover above the gearbox case. Align the hollow pin holes in the front cover with the locating pins then lower the cover onto the pins. Release and remove the hoist.
- (d) Unscrew and remove the locating pins, then with the driver (Tool 766) assemble the three hollow pins (01/4-150) to the vacated positions.
- (e) Screw a bolt (01/4-140) through each hollow pin and lightly tighten to secure the front cover.
- W. Backlash Checks on Gear Assemblies and Bevel Gear Teeth Engagement.
- (1) Check the backlash between the inclined bevel gear and the vertical bevel gear with indicating fixture (Tool 714) (Fig.520).
- (a) Locate the fixed collar on the quill in the internal circumference of the bevel gear drive shaft.
- (b) Tighten the nut on the end of the fixture to withdraw the draw bolt and wedge, locking the quill in the internal circumference of the bevel gear drive shaft.

OVERHAUL

- (c) Position the fixture housing around the slave nut and tighten the large nut on the fixture stem, this takes up the end-float of the three bearings in the bearing housing assembly.
- (d) Attach the dial gauge to a suitable support assembly so that the plunger on the gauge is in contact with the arm on the fixture between the two scribed lines.
- (e) Set the dial gauge and read off the amount of backlash. For the desired amount of backlash refer to the Fits and Clearance Schedule 72-63-00 322.

NOTE: If the backlash is within the limits quoted remove the indicating fixture and gearbox front cover (Ref.W.(2)(j),(k)) then proceed to para.W.(4).

- (2) Insufficient backlash of main bevel gears.

NOTE: To rectify insufficient backlash reduce the thickness of the vertical bevel gear drive assembly adjusting washer (02/1-520), and the inclined bevel gear drive adjusting washer (02/1-100) an equal amount.

- (a) Release and remove the indicating fixture.
- (b) Release the six bolts securing the bearing housing/ inclined bevel gear to the gearbox case and remove the assembly from the gearbox case.
- (c) Assemble the bearing housing/inclined bevel gear into the immobilizer (Tool 536) (Ref.para.V.(2)(a) to (c)) and using wrench (Tool 535) remove the slave nut. Remove the bearing housing/ inclined bevel gear from the immobilizer.
- (d) Assemble the bearing housing/inclined bevel gear into the support (Tool 717) and, using the driver (Tool 716), press the inclined bevel gear, inner ring of roller bearing (02/1-90) adjusting washer (02/1-100) and one half of the inner ring of ball bearing (02/1-270) from the housing.

MK.610-14-28  
OVERHAUL

- (e) Remove the two inner rings and the adjusting washer by locating the claws of the mechanical puller (Tool 723) under the inner ring of bearing (02/1-90), lock the claws by tightening the adjusting nut. Locate the pad into the internal circumference of the bevel gear drive and rotate the thrust screw and remove the inner rings and adjusting washer.
- (f) Assemble the inner ring of the ball bearing to its location in the bearing housing.
- (g) Assemble the inner ring of the roller bearing (02/1-90) and the adjusting washer (02/1-100) of the correct (amended) thickness to the bevel gear with driver (Tool 532) and support (Tool 531).
- (h) Assemble the retaining slave nut to the bevel gear (Ref. para.V.(2)(a) to (c)).
- (j) Unscrew the three bolts (01/4-140) securing the front cover to the gearbox case. Insert the quill of the mechanical puller (Tool 715), into the hollow pins, tighten the spindle and, by unscrewing the extractor screw, withdraw the pins from the gearbox case and the front cover.
- (k) Screw the three locating pins (Tool 526, 527, 528) into the holes vacated by the hollow pins and using pullers (Tool 1668) withdraw the front cover. Remove the pullers, attach the lifting fixture (Tool 1867) to the cover and using a hoist remove the front cover from the gearbox.
- (l) Unscrew the three bolts (02/1-410) securing the vertical bevel gear drive bearing assembly to the gearbox case at the location of the strainer housing.
- (m) Unscrew the nut on the immobilizer (Tool 965) disengage the captive 'C' washer from the stud and remove the immobilizer then remove the bevel gear drive/bearing assemblies from the gearbox.
- (n) Remove the nut (02/1-420) (bevel gear end) with the wrench (Tool 657) and holder (Tool 658) (Ref. para.U.(5) (a) to (d)).

SUB-ASSEMBLY

**72-63-00**

Page 561

OVERHAUL

- (p) Remove the adjusting washer (02/1-520), ball bearing (02/1-500), inner ring and rollers of the roller bearing (02/1-430) and bearing housing (02/1-510) from the vertical bevel gear drive assembly by locating the three claws of the mechanical puller (Tool 736) under the bearing assemblies, locking them by tightening the locking nut. Locate the pad in the internal circumference of the vertical bevel gear drive assembly and operate the thrust screw.
  - (q) Re-assemble the adjusting washer (02/1-520) of the correct (amended) thickness, bearing housing (02/1-510), the ball bearing (02/1-500) and the inner ring of the roller bearing (02/1-430) to the vertical bevel gear drive assembly, retain with the nut (02/1-420) (Ref. para. U(4)(a) and (b) (5)(a) to (f)).
  - (r) Assemble the vertical bevel gear drive assembly to the gearbox case (Ref. para. U(6) and (7)).
  - (s) Assemble the immobilizer (Tool 965) (Ref. para. U(8)).
  - (t) Temporarily assemble the front cover to the gearbox case (Ref. para. V.(6)).
  - (u) Assemble the inclined bevel gear drive/bearing housing to the gearbox case (Ref. para. V.(4) and (5)).
  - (v) Recheck backlash; refer to para. W.(1).
- (3) Excessive backlash.
- NOTE: To rectify excessive backlash increase the thickness of the vertical bevel gear drive assembly, adjusting washer (02/1-520) and the inclined bevel gear drive adjusting washer (02/1-100) an equal amount.
- (a) Refer to para. W.(2) for procedure on removal and assembly of bevel gear drives.
- (4) Assemble the starter IDG spur gear drive into the previously installed flanged ball bearing (03/1-190) in the gearbox case (Ref. Fig. 521).
- (a) Support the spur gear drive assembly in the gearbox, on the centre line relative to its final location in the gearbox.

- (b) Assemble the guide (Tool 719) to the front cover mounting face on the gearbox case and secure with the two captive bolts.
  - (c) Insert the adapter (Tool 720) through the bush in the guide and locate it to the spur gear drive assembly.
  - (d) Insert the adapter (Tool 721) into its location in the mechanical driver (Tool 718), secure it to the mechanical driver with the washer and bolt.
  - (e) Position the mechanical driver to the gearbox case locating the adapter (Tool 721) into the location of the IDG spur gear shaft support bearing, and the pressure pad on the mechanical driver onto the adapter (Tool 720).
  - (f) Screw in the pressure screw on the mechanical driver and press the spur gear drive assembly into its location in the gearbox. Ensure that the spur gear teeth engage correctly with their corresponding teeth on the driving spur gear (vertical bevel gear drive shaft) and the idler gear, by turning both shafts to align them.
  - (g) Unscrew the pressure screw and remove the mechanical driver and adapters. Unscrew the two captive bolts and remove the guide.
- (5) Assemble the keywasher (03/1-150) and nut (03/1-140) to the IDG end of the spur gear drive assembly.
- (6) Secure the nut to the spur gear drive assembly by tightening it with wrench (Tool 670) and immobilizer (Tool 669) (Ref.Fig.522).
- (a) Locate the splined spigot on the immobilizer with the corresponding splines on the internal circumference of the starter end of the spur gear drive shaft. Secure the immobilizer to the front cover mounting face with the two captive bolts.
  - (b) Locate the lugs on the wrench with the corresponding castellations on the nut.
  - (c) Torque-tighten the nut to 110 lbf ft (149,0 N.m).
  - (d) Unscrew the captive bolts and remove the immobilizer and the wrench from the gearbox.

NOTE: Do not peen the keywasher at this stage in the gearbox build.

- (7) Assemble the front cover (Ref.para.V.(6)).
- (8) Check the backlash between the starter/IDG spur gear drive and the vertical bevel gear drive assembly with the indicating fixture (Tool 711) (Ref.Fig.523).

NOTE: On an assembly using new spur gears the backlash check is an audible rattle check between the contacting teeth of the two gear wheels.

- (a) Locate the quill in the internal circumference of the starter/IDG spur gear drive at the starter location on the spur gear drive.
- (b) Tighten the nut on the end of the fixture to withdraw the draw bolt and wedge, locking the quill into the starter/IDG spur gear drive.
- (c) Assemble the adapter (Tool 748) to two of the front cover securing bolt locations close to the starter/IDG spur gear drive retain with two captive bolts. Assemble the dial indicator to the adapter so that the plunger on the gauge is in contact with the arm on the fixture between the two scribed lines.
- (d) Set the dial gauge and read off the amount of backlash. For the desired amount of backlash refer to the Fits and Clearance Schedule 72-63-00 338.

NOTE: If the backlash is not within the specified limits, one or both of the spur gears must be renewed.

- (e) Unscrew the nut on the fixture, release the wedge and remove the fixture.
- (9) Check the backlash between the standby/main hydraulic pumps spur gear drive and the idler spur gear with the indicating fixture (Tool 726), and immobilizer (Tool 712) (Ref.Fig.524).

NOTE: On an assembly using new spur gears the backlash check is an audible rattle check between the contacting teeth of the two gear wheels.

- (a) Locate the quill of the indicating fixture in the spur gear drive at the location of the main hydraulic pump mounting adapter.

- (b) Tighten the nut on the end of the fixture to withdraw the draw bolt and wedge, locking the quill into the main/standby hydraulic pumps spur gear drive.
- (c) Assemble the adapter (Tool 748) to the front cover and secure with the two captive bolts, assemble the dial gauge so that the plunger on the gauge is in contact with the arm on the fixture between the two scribed lines.
- (d) Insert the quill of the immobilizer (Tool 712) into the idler gear shaft as viewed through the location of the IDG mounting position, engage the slot on the plate with one of the IDG shaft support bearing retaining bolts.
- (e) Tighten the nut on the end of the immobilizer to withdraw the draw bolt and wedge, locking the quill into the idler shaft.
- (f) Set the dial gauge and read off the amount of backlash. For the desired amount of backlash refer to the Fits and Clearance Schedule 72-63-00 348.
- (g) Unscrew the nut on the fixture, release the wedge and remove the fixture. Unscrew the two captive bolts and remove the adapter and dial gauge.

NOTE: The immobilizer (Tool 712) is not removed at this stage in the procedure.

NOTE: If the backlash is not within the specified limits, one or both of the spur gears must be renewed.

- (10) Check the backlash between the starter/IDG spur gear drive and the idler gear with the indicating fixture (Tool 725) (Ref.Fig.525).

NOTE: On an assembly using new spur gears the backlash check is an audible rattle check between the contacting teeth of the two gear wheels.

- (a) Insert the quill of the indicating fixture into the starter/IDG spur gear drive at the location of the starter mounting position in the gearbox case.

- (c) Position the adapter (Tool 748) to two of the front cover securing bolt locations, retain with two captive bolts. Assemble the dial gauge to the adapter so that the plunger on the gauge is in contact with the arm on the fixture between the two scribed lines.
- (d) Set the dial gauge and read off the amount of backlash. For the desired amount of backlash refer to the Fits and Clearance Schedule 72-63-00 388.

NOTE: If the backlash is not within the specified limits, one or both of the spur gears must be renewed.

- (e) Unscrew the nut on the indicating fixture, release the wedge and remove the fixture. Unscrew the two captive bolts and remove the adapter and dial gauge.
  - (f) Unscrew and remove the nut securing the immobilizer (Tool 712) to the IDG support bearing location, release the wedge and remove the immobilizer.
- (13) Assemble the immobilizer (Tool 669) and wrench (Tool 670) to the starter/IDG spur gear drive (Ref. para.U.(6)(a)(b) and (d)) and remove the nut (03/1-140) and the keywasher (03/1-150) from the spur gear drive.
- (14) Remove the starter/IDG spur gear drive from the ball bearing (03/1-190) using the mechanical puller (Tool 724) (Ref.Fig.527).
- (a) Locate the three claws of the puller to the lip on the ball bearing outer ring, as viewed through the IDG mounting location in the gearbox.
  - (b) Lock the claws into their location by tightening the adjusting nut on the puller.
  - (c) Screw in the thrust screw, ensure the pad is located in the internal circumference of the spur gear drive and press the spur gear drive out of the ball bearing.
  - (d) Remove the spur gear drive from the gearbox.
  - (e) Unlock the three claws and remove the mechanical puller.

OVERHAUL

(f) Remove the immobilizer (Tool 965) from the vertical bevel gear drive shaft.

(15) Temporarily assemble the front cover to the gearbox case (Ref.paras.V.(6)).

(16) Rotate the inclined bevel gear drive in both directions to obtain the blue marking on the engaging teeth.

(17) Check the engagement of the bevel gear teeth.

NOTE: Following any adjustment for bevel gear teeth engagement, a backlash check must be carried out to ensure the backlash remains correct. If satisfactory teeth engagement cannot be achieved then one or both bevel gears must be renewed.

NOTE: Refer to paras.W.(2)(a) to (r) for the removal and installation of the bevel gear drive assemblies.

(a) Visually examine both sides of the bevel gear teeth to ensure satisfactory engagement; refer to Fig.528 for the indication of the correct engagement.

NOTE: The engagement will be towards the toes, allowing for central engagement under normal running conditions.

(b) Remove all the traces of the marking blue from the bevel gears.

NOTE: If the correct engagement of the teeth is achieved proceed to para.W.(18).

(c) If the engagement of the teeth varies from the toe to the heel, reposition the gears in relation to each other by engaging a high point on one gear with a low point on the other.

(d) If the engagement of the teeth is on the toes withdraw both of the bevel gears out of engagement by decreasing the inclined bevel gear adjusting washer (02/l-100) thickness and increasing the vertical bevel gear adjusting washer (02/l-520) thickness equal amounts.

- (e) If the engagement of the teeth is on the heels, increase the engagement of the bevel gears by increasing the inclined bevel gear adjusting washer thickness and decreasing the vertical bevel gear adjusting washer thickness equal amounts.
- (f) If the engagement of the teeth on one gear is towards the tip (addendum) that gear must be withdrawn and the other gear inserted an equal amount.
- (g) If the engagement of the teeth on one gear is towards the root (dedendum) that gear must be inserted and the other gear withdrawn an equal amount.
- (18) Assemble the starter/IDG spur gear drive assembly into the previously installed ball bearing (03/1-190) in the gearbox case (Ref. para.W.(4), (5) and (6).
- (19) Peen the keywasher (03/1-150) (IDG end) as assembled to the starter/IDG spur gear drive (Ref.Fig.529).
- (a) Assemble the guide (Tool 719) to the front cover mounting face on the gearbox case. Using the two captive bolts, lightly tightened, secure the guide to the face.
- (b) Insert the adapter (Tool 720) through the bush in the guide and locate it to the spur gear drive.
- (c) Insert the peening tool (Tool 786) into its location in the mechanical driver (Tool 718), retain with the washer and bolt.
- (d) Assemble the mechanical driver to the gearbox case, locating the pressure pad on the mechanical driver to the adapter (Tool 720) and the peening tool around the protruding spur gear drive, ensuring that the sprung locator on the peening tool is positioned in one of the 10 detents in the nut (03/1-140).
- (e) Screw in the pressure screw until resistance is felt, then screw in approx. two and one half turns.

- (f) Unscrew the pressure screw and remove the mechanical driver, peening tool and the adapter. Unscrew the captive bolts and remove the guide.
- (20) Assemble the two ring seals (03/1-30) to the two grooves in the splined shaft (03/1-40).
- (21) Assemble the splined shaft/ring seals to the location in the end of the starter/IDG spur gear drive as viewed from the IDG mounting location, refer to Fig.531.
- (22) Assemble the retaining sleeve (03/1-20) into the splined shaft and retain the sleeve and the splined shaft to the spur gear drive assembly with the bolt (03/1-10). Ensure the bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten between 67 and 73 lbf in. (7,6 and 8,3 N.m).
- (23) Assemble the front cover to the gearbox case (Ref.Fig.530).
- (a) Assemble the gasket (01/4-380) to the hollow pin (01/9-140) at the front cover mounting face on the gearbox case.
- (b) Assemble the gasket (01/4-310) to the gearbox front cover mounting face.
- (c) Assemble the locating pins (Tools 526, 527 and 528) to the hollow pin locations in the gearbox case.
- (d) Locate and screw the two captive bolts of the lifting fixture (Tool 1867) into the extraction holes in the front cover.
- (e) Attach a hoist to the fixture then raise and position the front cover above the gearbox case. Align the hollow pin holes in the front cover with the locating pins then lower the cover onto the pins. Release and remove the hoist.
- (f) Remove the locating pins and to the vacated positions assemble the three hollow pins (01/4-150) with the driver (Tool 766).
- (g) Insert a bolt (01/4-140) into each hollow pin and secure the front cover to the gearbox case.

- (h) Assemble the nine long bolts (01/4-120) nine washers (01/4-130) and bracket (01/4-290) to their appropriate positions then assemble the remaining 44 bolts (01/4-100) 44 washers (01/4-110) and bracket (01/4-280). Ensure all 56 bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- X. Assemble the Oil Transfer Assembly and the Seal Ring to the Gearbox (Ref.Fig.531).
- (1) Assemble the two sealing rings (03/1-100) to the grooves in the oil transfer sleeve (03/1-110).
  - (2) Assemble the sleeve and the floating keyring (03/1-90) to the oil housing (03/1-80), ensuring that the lugs and cutaways on the keyring align with the corresponding lugs and cutaways on the sleeve and housing.
  - (3) Assemble the oil metering plate (03/1-120) to the location around the starter/IDG spur gear drive, as viewed through the IDG mounting location. Locate the 12 holes in the metering plate to the 12 D-headed bolts protruding through the IDG gear shaft support mounting face and the two smaller holes in the metering plate with the two headless pins.
  - (4) Assemble the oil transfer ring/floating keyring/oil housing to abut the metering plate and locate the oil housing on the 12 bolts and two headless pins.
  - (5) Assemble the multiple jet (03/1-70) to the jet body (03/1-60).
  - (6) Assemble the multiple jet/jet body to the recess in the oil housing, locating the jet body on the two bolts.
  - (7) Retain the jet body and the oil housing to the gearbox case with 12 nuts (03/1-50). Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten between 67 and 73 lbf in. (7,6 and 8,3 N.m).
  - (8) Using a 0.0015 in. (0,0381 mm) feeler gauge check that the mating faces of the oil housing and metering plate are in full contact.

- (9) Assemble the sealing ring (03/1-210) to the groove in the internal circumference of the starter/IDG spur gear drive, starter end. Retain the sealing ring in the groove with the retaining ring (03/1-200).

**Y. Assemble the Coupling Shaft and Bearing Housing Assembly.**

- (1) Unscrew and remove the six bolts (02/1-10) retaining the bearing housing/inclined bevel gear to the gearbox case. Remove the bearing housing/inclined bevel gear.
- (2) Remove the slave nut (Tool 728) from the inclined bevel gear.
  - (a) Position the immobilizer (Tool 536) in a bench vice.
  - (b) Position the bevel gear assembly into the immobilizer locating the bevel gear teeth with the teeth in the immobilizer and the three studs on the immobilizer with the corresponding holes in the bearing housing assembly. Retain the bearing housing assembly to the three studs with the three nuts (Tool 537).
  - (c) Locate the 10 lugs of the wrench (Tool 535) with the corresponding castellation in the slave nut, unscrew and remove the nut.
  - (d) Unscrew the three nuts (Tool 537) and remove the wrench and the immobilizer.
- (3) Assemble the coupling shaft/spacer sleeve (02/1-40, 50) to the inclined bevel gear.
- (4) Assemble the keywasher (02/1-30) and the nut (02/1-20) retaining the inclined bevel gear, and the coupling shaft/spacer sleeve.
  - (a) Position the immobilizer (Tool 536) in a bench vice.

OLYMPUS 593

OVERHAUL

- (b) Position the bevel gear assembly into the immobilizer, locate the bevel gear teeth with the teeth in the immobilizer and the three studs on the immobilizer with the corresponding holes in the bearing housing assembly. Retain the bearing housing assembly to the three studs with the three nuts (Tool 537).
  - (c) Locate the 10 lugs of the wrench (Tool 535) with the corresponding castellations in the nut. Torque-tighten the nut to 170 lbf ft (230 N.m).
  - (d) Unscrew the three nuts (Tool 537) and remove the wrench and the immobilizer.
- (5) Using the peening tool (Tool 1708) peen the keywasher.
- (6) Install flexible coupling shaft and bearing housing assembly (Ref.Fig.533).
- (a) Assemble six headed pins (01/10A-28) to their locations in the bearing housing.
  - (b) Assemble gasket (02/1A-310) to the bearing housing.
  - (c) Assemble 18 bolts (01/10A-27) to the outer row of holes in the bearing housing, then locate the assembly in the gearbox and with the headless pin aligned with its location, engage the bevel gears.
  - (d) Secure the bearing housing to the gearbox with 12 bolts (02/1A-15) and six bolts (02/1A-10) with lubricant 'A' applied. Ensure that each bolt has a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m) then torque-tighten to 100 lbf in. (11,3 N.m).

2. Assemble the IDG QAD Coupling Ring Assembly and the Mounting Bracket.

- (1) Remove the gearbox from the build stand to a suitable workbench, using lifting fixture (Tool 795), lifting fixture (Tool 827), lifting adapter (Tool 793), lifting adapter (Tool 794) and a suitable lifting mechanism (Ref.Fig.534).
  - (a) Assemble and secure the lifting adapter (Tool 794) to its location on the gearbox case close to the main and stand-by hydraulic pump mounting locations.
  - (b) Assemble and secure the lifting adapter (Tool 793) to its location on the gearbox case close to the inclined bevel gear drive assembly mounting location.
  - (c) Assemble the lifting fixture (Tool 827) to the centre of the top slot in the lifting fixture (Tool 795) and secure the two fixtures together with the captive bolt, washer and nut.
  - (d) Attach a hoist to the lifting fixture and position the fixture close to the adapters assembled to the gearbox case. Ensure the lifting plate with the locking pin and fulcrum pin (part of fixture (Tool 795)) is next to the adapter (Tool 793). Unscrew and remove the locking pin. Screw both fulcrum pins into their respective adapters then screw in the locking pin.
  - (e) Raise the hoist so as to take up the weight of the gearbox. Unscrew the 32 captive bolts securing the gearbox case to the build stand (Tool 494) then remove the gearbox from the stand.
  - (f) Position the gearbox above a suitable work surface. Hold the gearbox, to prevent rotation, then remove the locking pin and rotate the gearbox 90 degrees to gain access to the IDG mounting face. Lower the hoist and position the gearbox on the work surface.

NOTE: The lifting equipment must be left attached to the gearbox.

- (2) Assemble the plain flange (01/8-60) to the coupling ring (01/8-80) (Ref.Fig.535).

NOTE: If difficulty is experienced in assembling the plain flange to the coupling ring/gearbox case, incorporate SB.72-118.

- (3) Assemble the flange/coupling ring to the IDG assembly location on the gearbox case, interpose the gasket (01/8-70) between the mating faces of the flange and the gearbox case. Align the three eccentric holes in the flange with the three larger holes in the gasket and gearbox case.
- (4) Assemble the three hollow pins (01/8-50) to the flange, secure the flange to the case using the 32 bolts (01/8-40). Ensure the bolts have a minimum locking (run-down) torque of 3-5 lbf in. (0,4 N.m). Torque-tighten to 100 lbf in. (11,5 N.m).
- (5) Assemble the mounting bracket (01/8-160) to the location in the gearbox case close to the IDG mounting location. Locate the boss on the bracket to the hole in the gearbox case and align the two retaining bolt holes in the bracket with the corresponding holes in the gearbox case.
- (6) Assemble the bracket (01/8-170) to the rear of the location on the gearbox case to which the mounting bracket is assembled.
- (7) Insert the two bolts (01/8-150) through the holes in the mounting bracket, gearbox case mounting location, and bracket. Assemble the two load spreading washers (01/8-140) and nuts (01/8-130) to the bolts. Ensure the nuts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m). Torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Assemble the spherical washer (01/8-20) to the locking bolt (01/8-10). Insert the spherical washer/bolt through the mounting bracket and engage the threads in the coupling ring, temporarily tighten the bolt.

AA. Prepare the Gearbox for Oil Flow Test and Pressure Test (Ref.Fig.535).

- (1) Assemble the 'O' ring (01/8-30) (SB.0L.593-72-8995-401) into the plain flange (01/8-60) assembled to the IDG mounting location.
- (2) Assemble the test blank (Tool 740) to the gearbox at the location of the IDG mounting position. Locate the interrupted threads of the blank in the coupling ring, rotate the blank through 30 deg to lock.
- (3) Ensure the coupling ring locking bolt has a locking (run-down) torque between 6 and 20 lbf in. (0,68 and 2,26 N.m) torque-tighten between 170 and 190 lbf in. (19,2 and 21,5 N.m) (Ref.72-09-00 Assembly).
- (4) Re-position the gearbox to the build stand (Tool 494).
  - (a) Attach a hoist to the lifting fixture then raise the hoist to take up the weight of the gearbox. Rotate the gearbox until the IDG mounting location is positioned at the bottom then screw in the locking pin.
  - (b) Lift the gearbox to its location on the build stand. Locate 29 captive bolts into the test blank and lightly tighten them.
  - (c) Remove both fulcrum and locking pins from the two adapters (Tool 793 and 794) then raise the hoist and lift the lifting fixtures clear of the gearbox, position them on a suitable support.
  - (d) Unscrew the two captive bolts in each of the adapters and remove the adapters from the gearbox.
- (5) Assemble the slave seal (FBS 68-C39) to the pressure test blank (Tool 722) and assemble the blank to the gearbox front cover at the location of the starter mounting position.

## AB. Oil Flow and Pressure Test the Gearbox.

### (1) Test equipment required.

- (a) Capable of a flow rate up to 120 gal/h (Imp.) (545 litres/hour) of oil at a temperature of 120 deg C with a delivery pressure up to 50 psig (345 Kpa) to the gearbox.
- (b) Oil specification lubricant A.

### (2) Prepare oil flow test/pressure test equipment.

- (a) Ensure that the correct amount of oil is contained in the test equipment.
- (b) Connect the flowmeter electrical plug and instrumentation plugs to their respective locations on the mobile test equipment.
- (c) Connect the rig oil pressure hose to the gearbox adapter (Tool 790) for engines Pre.SB.0L.72-9036-419 or (Tool 3151) for engines SB.0L.72-9036-419.

**NOTE:** Tool 790 is fitted at the pressure filter location. Tool 3151 is fitted to the oil inlet flange on the front cover assembly.

- (d) Connect the rig oil return hose to the gearbox adapter (Tool 555) at the scavenge filter location for engines Pre.72-9036-419 or (Tool 3149) for SB.72-9036-419.
- (e) Ensure that the circulating pump is switched 'OFF' then connect the test equipment to an earthed electricity supply.
- (f) Open the oil return stop valve on the test equipment.

### (3) Oil flow test the gearbox.

- (a) Switch 'ON' the circulating pump and adjust the pressure controller to give a delivery oil pressure of not more than 5 psig (34,5 Kpa) for circulating and venting purposes. Ensure the flowmeter is working.

SUB-ASSEMBLY

72-63-00

Page 595

Dec 31/99

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

(b) Release trapped air from the gearbox by opening the vent valve on the blank (Tool 939). Close the valve when all air has been expelled.

(c) Place the transparent protection cover (Tool 797) over the gearbox assembly and ensure the vent valve and hand turning point are in line with the access ports in the cover and the gearbox assembly is clearly visible from all angles.

**WARNING:** TRANSPARENT PROTECTION COVER MUST NOT BE REMOVED WHILST GEARBOX IS PRESSURIZED WITH OIL. ADEQUATE VENTILATION IS ESSENTIAL. PROTECTIVE CLOTHING MUST BE WORN.

(d) Switch on the oil heater and raise the oil temperature to  $120 \text{ deg C} \pm 5 \text{ deg C}$ . When the circulating oil is at the required temperature allow approximately 15 minutes for stabilization of the gearbox case temperature, then switch 'OFF' the circulating pump. Carefully release any trapped air from the gearbox through the vent valve.

(e) On completion of venting, tighten the vent valve and remove the wrench. Switch 'ON' the circulating pump and adjust the oil pressure to give a differential between the oil pressure and scavenge of 30 psig (207 Kpa).

(f) Maintain the oil flow pressure rate and record the oil flow rate indicated by the flowmeter.

(i) The oil flow for engines Pre.SB.0L.72-9036-419 must be within the acceptance limits of 75-100 gal/h (Imp.) (340 to 454 litres/hour).

(ii) The oil flow for engines SB.0L.72-9036-419 Standard must be within the acceptance limits of 90-120 gal/h (Imp.) (409 - 545 litres/hour).

(g) On completion of a satisfactory flow test proceed with the pressure testing of the gearbox (para.AB.(5)(e)).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

(h) Should the oil flow rate be below the acceptance figure quoted, switch 'OFF' the oil heater, circulating pump and electrical supply to the equipment. Disconnect, and safely store the oil flowmeter.

(4) Investigate and rectify unsatisfactory oil flow limit.

NOTE: Before commencing disassembly of the gearbox components for examination of oil jets, examine the mobile pressure test equipment and associated items for possible malfunction.

(a) Prepare for investigation.

CAUTION: ENSURE THAT THE PRESSURE TEST EQUIPMENT IS SWITCHED 'OFF' AND ISOLATED FROM THE ELECTRICITY SUPPLY.

(b) Open the vent valve to release the pressure within the gearbox.

(c) Allow sufficient time for the assembly to cool to a safe handling temperature.

(d) Remove the protection cover then disconnect the oil pressure and scavenge hoses.

(e) Withdraw the build stand locking pin and rotate the gearbox until the vent valve is at the lowest point of the gearbox assembly. Allow the oil in the gearbox to drain and return such oil to the mobile test equipment.

(f) Rectify the cause of inadequate or excessive oil flow and carry out a further oil flow check.

(5) Oil pressure test gearbox assembly.

(a) Open the return stop valve on the mobile pressure test equipment, switch 'ON' the electricity supply and circulating pump and adjust the pressure controller to give a delivery pressure of not more than 5 psig (34,5 Kpa) for circulating and venting purposes.

WARNING: TRANSPARENT PROTECTION COVER MUST NOT BE REMOVED WHILST GEARBOX IS PRESSURIZED WITH OIL. ADEQUATE VENTILATION IS ESSENTIAL. PROTECTION CLOTHING MUST BE WORN.

MK.610-14-28  
OVERHAUL

sneema

- (b) Ensure that the transparent protection cover (Tool 797) is correctly positioned over the gearbox. Switch 'ON' the oil heater to raise the oil temperature to 120 deg C.
  - (c) Switch 'OFF' the oil circulating pump and carefully release trapped air from the gearbox by opening the vent valve in the blank (Tool 939).
  - (d) Tighten the vent valve when all air has been expelled then switch 'ON' the oil circulating pump.
  - (e) Maintain the oil temperature at 120 deg C  $\pm$  5 deg C. Gradually increase the oil inlet pressure to 50 psig (345 Kpa) and adjust the return stop valve to 40 psig (276 Kpa).
  - (f) Maintain the pressure test conditions for 15 minutes and observe the gearbox for oil leakage from QAD couplings, flange joints, main and stand-by hydraulic pump Sealol seals.
  - (g) During the pressure test, rotate the gears using the hand turning equipment (Ref.72-09-01, Sub-Assembly) in order to fully test the Sealol seals. If necessary, extend the test time to ensure the seals seat correctly and any leakage of oil ceases.
  - (h) Oil leakage is unacceptable, but slight seepage of oil can be accepted.
- NOTE:** An oil leak is considered as drops or globules of oil forming within the specified time and conditions of the pressure test. Oil seepage is considered as oil dampness which may spread but does not form a droplet or globule within the specified time and conditions for the pressure test.
- (j) On completion of satisfactory pressure test, or to rectify oil leakage, ensure the test equipment is switched 'OFF' and isolated from the electricity supply.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (k) Open the vent valve to release pressure within the gearbox.
  - (l) Allow sufficient time for the assembly to cool to a safe handling temperature.
  - (m) Remove the protection cover, then disconnect the oil pressure and scavenge hoses.
  - (n) Withdraw the build stand locking pin and rotate the gearbox until the vent valve is at the lowest point of the gearbox assembly. Allow the oil in the gearbox to drain into a suitable container and return such oil to the mobile test equipment.
- (6) Rectify oil leakage from joint faces.
- (a) If leakage between joint faces is attributed to insufficient tightness of bolts, re-check the torque values in accordance with the tightening procedures detailed in the appropriate sections of this sub-assembly.
  - (b) If leakage between joint faces cannot be rectified by torque-tightening checks, it will be necessary to separate the appropriate flange joints for further investigation.
- (7) Rectify oil leakage from QAD couplings.
- (a) Remove QAD couplings.

NOTE: This procedure applies to the gearbox front cover or gearbox case.

- (i) Remove the protector.
- (ii) Remove the coupling ring locking bolt and spherical washer, then remove the bolts securing the coupling to the gearbox or front cover and carefully remove the coupling flange and seal.
- (iii) Examine all components and sealing surfaces, especially gaskets and seal rings for cause of leakage. Thoroughly clean all components and re-assemble in accordance with the appropriate assembly procedure.

SUB-ASSEMBLY

OVERHAUL

- (8) Oil leakage from the Sealol seals of the hydraulic pumps will necessitate the removal and replacement of the seals.
- (9) After carrying out any rectification, a further pressure test of the gearbox will be necessary until a satisfactory test is achieved.

AC. Remove the Oil Flow Test and Pressure Test Equipment from the Gearbox.

- (1) Remove the pressure test adapter (Tool 790 or 3151) from the the gearbox. For engines Pre.SB.0L.72-9036-419, assemble the plug (72-63-01/2-250) and Corrujoint seal (72-63-01/2-260) to the vacated location and torque-tighten between 230 and 250 lbf in. (26,0 and 28,2 N.m). Wire-lock the plug to the nut assembly.
- (2) Remove the pressure test adapter (Tool 555 or 3149) from the location of the scavenge filter in the gearbox. Assemble the magnetic plug (01/2-80) to the vacated location and torque-tighten to 30 lbf ft (40,7 N.m). Wire-lock the plug to the nut assembly.
- (3) Remove test blank from inclined bevel gear location.
  - (a) Unscrew the 18 retaining bolts and remove the blank.
- (4) Unscrew the coupling ring locking bolt (01/3-10) at the location of the starter mounting position, unlock the coupling ring (01/3-70) (Ref.72-09-00 Disassembly). Rotate the test blank (Tool 722) through 30 deg, remove the blank.
- (5) Remove the remaining test blanks from the gearbox as detailed in Table 505.
- (6) Place all test blanks into the container (Tool 791).

## Pressure Test Blank

## Location

(Tool 771)	Oil inlet facing on the front cover (engines Pre.SB.0L.72-9036-419)
(Tool 773)	Oil scavenge facing on the front cover
(Tool 772)	Oil pressure transmitter facing
(Tool 772)	Oil pressure switch facing

Removal of Pressure Test Blanks from the Gearbox  
Table 505

AD. Assemble the Oil Pressure Transmitter and Switch to the Front Cover (Pre SB.72-96).

- (1) Ensure two Corruplus seals are fitted to the grooves in the base of the oil pressure transmitter (79-34-01/1-10).
- (2) Assemble the transmitter to its location on the front cover. Locating the two fouling pegs on the transmitter with the corresponding holes in the front cover.
- (3) Retain the transmitter to the front cover with the seven bolts (79-34-01/1-20), torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**NOTE:** The spacing of the two fouling pins on the base of the oil pressure transmitter are such that the transmitter can only be assembled to its correct location.

- (4) Ensure two Corruplus seals are fitted to the grooves in the base of the oil pressure switch.

SUB-ASSEMBLY

72-63-00

Page 598.3

Dec 31/99

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (5) Assemble the switch to the location on the front cover, locating the two fouling pegs on the switch with the corresponding holes in the front cover.
- (6) Retain the switch to the front cover with seven bolts (79-34-02/1-20), torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

AE. Assemble Blanks to the Hand Turning Equipment Mounting Face, Oil Pressure Transmitter and Switch Mounting Faces on the Front Cover (SB.72-96).

- (1) Assemble the gasket (01/4-80) to the cover blank (01/4-70) (Ref.SB.72-41), then assemble the cover blank/gasket to the hand turning equipment mounting face. Secure the blank with seven washers (01/4-60) and bolts (01/4-50). Ensure that the bolts have a minimum locking (run-down) torque of 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 90 and 100 lbf in. (10,2 and 11,3 N.m).
- (2) Assemble two Corruplus seals (01/4-470 and 480) to each of the two blanking covers (01/4-460). Assemble a cover to both the oil pressure transmitter and oil pressure switch mounting faces on the front cover.
- (3) Secure each cover with seven bolts (01/4-450) torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

AF. Assemble the Main Hydraulic Pump Rim Clenching Clamp.

- (1) Select the two nuts (01/6-20) and two eye-bolts (01/6-80) such that the torque required to overcome screw thread friction only is between 6 and 20 lbf in. (0,7 and 2,3 N.m). Identify the selected nuts and eye-bolts for reassembly.
- (2) Assemble the two plain segments (01/6-110), bossed segment (01/6-90) and bossed segment (01/6-100) in a circular position. Retain all the segments together with the three straight headed pins (01/6-70), flat washers (01/6-60) and split cotter pins (01/6-50). Locate the pins through the aligning holes in the respective segments, assemble the flat washer to the pin, insert the split cotter pin into the hole in the headed pin and lock it (Ref.72-09-00 Assembly).

SUB-ASSEMBLY

**72-63-00**

Page 598.4

Sep 1/80

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Assemble the two eye-bolts (01/6-80) to the locations in the bossed segments, retain them with the two straight headed pins (01/6-70), flat washers (01/6-60) and split cotter pins (01/6-50). Locate the pins through the aligning holes in the respective segments and eye-bolts, assemble the flat washers to the pins and insert a split cotter pin into the hole in each pin and lock it. (Ref.72-09-00 Assembly).

AG. Assemble the Stand-by Hydraulic Pump Rim Clenching Clamp.

- (1) Select the two nuts (01/6-140) and two eye-bolts (01/6-200) such that the torque required to overcome screw thread friction only is between 6 and 20 lbf in. (0,7 and 2,3 N.m). Identify the selected nuts and eye-bolts for reassembly.
- (2) Assemble the two plain segments (01/6-230), bossed segment (01/6-210) and bossed segment (01/6-220) in a circular position. Retain all the segments together with the three straight headed pins (01/6-190), flat washers (01/6-180) and split cotter pins (01/6-170). Locate the straight pins through the aligning holes in the respective segments, assemble the flat washer to the pin, insert the split cotter pin into the hole in the straight headed pin and lock it (Ref.72-09-00 Assembly).
- (3) Assemble the two eye-bolts (01/6-200) to the two locations in the bossed segment, retain them with the two straight headed pins (01/6-190), flat washers (01/6-180) and split cotter pins (01/6-170). Locate the pins through the aligning holes in the respective segments and eye-bolts, assemble the flat washers and insert the split cotter pin into the hole in the straight headed pin and lock it (Ref.72-09-00 Assembly).

AH. Bedding Check on the Stand-by and Main Hydraulic Pump Clenching Clamps.

- (1) After completing assembly of main and stand-by hydraulic pump clenching clamps carry out a bedding check (Ref.72-09-00 Inspection/Check).

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

AJ. Assemble Protectors to the Gearbox (Ref.Fig.536).

- (1) Assemble protector at inclined bevel gear location.
  - (a) Assemble the protector (Tool 3126) over the shaft, engage the bolts protruding from the gearbox flange, then secure the protector with the hook bolts and knurled nuts.
- (2) Assemble the protector (Tool 778) to the gearbox at the location of the starter mounting position, ensure the three clips on the protector are located around the coupling ring.
- (3) Assemble the protectors (Tools 505 and 506) to the gearbox at the location of the oil inlet and scavenge facings.
- (4) Assemble the sealing ring (01/7-40) to the groove in the blank assembly (01/6-120).
- (5) Assemble the blank assembly/sealing ring to the gearbox at the location of the main hydraulic pump mounting position. Locate the stepped pin in the pump adapter with the corresponding hole in the blank assembly. Retain the blank assembly to the adapter with the clenching clamp (01/6-10) (Ref. 72-09-00 Assembly).
  - (a) Locate the two eye-bolts through their respective locations in the bossed segments.
  - (b) Assemble the spherical washer, lockwasher and selected nut to the inner eye-bolt, torque-tighten it between 55 and 60 lbf in. (6,2 and 6,8 N.m). Slacken the nut and retorque-tighten it between 55 and 60 lbf in. (6,2 and 6,8 N.m).
  - (c) Assemble the spherical washer, lockwasher and selected nut to the outer eye-bolt, torque-tighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m). Slacken the nut and retorque-tighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m).

- (6) Assemble the sealing ring (01/7-120) to the groove in the blank assembly (01/6-270).
- (7) Assemble the blank assembly to the gearbox at the location of the stand-by hydraulic pump mounting position. Locate the stepped pin in the pump adapter with the corresponding hole in the blank assembly. Retain the blank assembly to the adapter with the clenching clamp (01/6-130) (Ref.72-09-00 Assembly).
  - (a) Locate the two eye-bolts through their respective locations in the bossed segments.
  - (b) Assemble the spherical washer, lockwasher and selected nut to the inner eye-bolt and torque-tighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m). Slacken the nut and retorquerighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m).
  - (c) Assemble the spherical washer, lockwasher and selected nut to the outer eye-bolt and torque-tighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m). Slacken the nut and retorquerighten it to between 55 and 60 lbf in. (6,2 and 6,8 N.m).
- (8) Unscrew the 29 captive bolts securing the test blank (Tool 740) to the stand and remove the gearbox from the build stand to a suitable working surface, using the lifting fixtures (Tools 795 and 827), lifting adapters (Tools 793 and 794) and a suitable lifting mechanism (Ref. para.2. sub-para.(1)(a) to (f)).
- (9) Unscrew the coupling ring locking bolt and unlock the coupling ring (Ref.72-09-00 Disassembly). Remove the test blank (Tool 740) from the IDG mounting face.
- (10) Assemble the protector (Tool 792) to the gearbox at the location of the IDG mounting position, ensure the three clips on the protector are located around the coupling ring.

FN12795

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (11) Using the lifting mechanism position the gearbox into a pallet. Remove the fulcrum pins and locking pin from the two adapters (Tool 793 and 794) and remove the lifting fixture from the gearbox. Unscrew the two captive bolts in each of the adapters and remove the adapters from the gearbox.
- (12) Despatch the gearbox to the intermediate case section for selection of mounting bracket adjusting plates.

AK. Assemble the Gearbox Module Identification Plate.

- (1) On return of the gearbox from the intermediate case section remove the protector (Tool 778) from the gearbox at the location of the starter mounting position.
- (2) Ensure the identification plate (72-00-05/1-90) is marked with the engine serial number. For details of marking procedure (Ref.72-09-00 Assembly).
- (3) Secure the plate to the starter mounting face on the gearbox with two washers (72-00-05/1-80) and bolts (72-00-05/1-70). Use tri-wing bit (Tool 1911) and tri-wing bit holder (Tool 1912) to tighten the bolts (Ref.72-09-00 Assembly).
- (4) Assemble the protector (Tool 778) to the starter mounting location, ensure the three clips on the protector are located around the coupling ring.

NOTE: The assembly is now ready to be transferred to engine build 72-00-00 Assembly.

## MAIN OIL PUMP - SUB-ASSEMBLY

### 1. General

- A. Prior to commencing assembly, refer to 72-09-00 Assembly for general assembly information.
- B. During the sub-assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to duplication of the title, e.g. nuts, bolts, washers, bearings, gears, housings, tubes, etc. When the item is a part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from a different breakdown are introduced, then the breakdown number will be quoted in addition e.g. bolt (72-32-01/1-10).
- C. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for the assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1002.
- D. Do not lubricate pump gears until the necessary backlash checks have been completed.
- E. During the assembly procedure, the oil scavenge pumps have been designated as No.1, No.2 and 3, No.4 and No.5. These refer to the LP compressor front bearing, the LP and HP compressor thrust bearings, the LP turbine and the HP turbine scavenge pumps.

### 2. Prepare the Pump Cases for Assembly

- A. Check Flatness and Condition of Pump Case Faces.
  - (1) If a new pump case (or cases) is being assembled remove the protector(s) and carry out a blueing check for flatness of the mating faces. Rectify as necessary to produce 85% blueing, then remove all traces of blue and replace the protector(s).
  - (2) If the original pump case (or cases) is being assembled remove the protector(s) and inspect for nicks, burrs, etc. Rectify as necessary, then replace the protectors.
  - (3) Check that all the threaded inserts are in a serviceable condition in accordance with 72-09-00 Assembly.

B. Assemble the Pins to the Pump Cases (Ref.Fig.501).

NOTE: This procedure is only applicable if No.1 or No.5 scavenge pump cases or the pressure pump case are new items. If the original cases are used the pins will be in position.

(1) Assemble the Pins to the Scavenge Pump Cases.

- (a) Remove the protector(s) and place No.1 and/or No.5 scavenge pump case(s) in an oven, pre-heated to 180 deg.C., for 30 minutes.
- (b) Place the straight pins (4-190) and/or (3-510) in a freezing agent for 10 minutes, the removal time to coincide with the removal of the case(s) from the oven.
- (c) Place the holding fixture (Tool 857) on the anvil of a hand press.
- (d) Using protective gloves remove No.5 scavenge pump case (if applicable) from the oven and place it over the location dowels (marked No.5) in the holding fixture, with its gear pockets uppermost (Ref.Fig.501). Remove the three longest pins (3-510) from the freezing agent and assemble them through the case to the stops in the fixture then remove the case from the fixture.
- (e) Still using the protective gloves, remove No.1 scavenge pump case (if applicable) from the oven and place it over the location dowels (marked No.1) in the holding fixture, with its gear pockets downwards (Ref.Fig.501). Remove the three shorter pins (4-190) from the freezing agent and assemble them through the case to the stops in the fixture, then remove the case from the fixture.
- (f) Allow the scavenge pump case(s) to cool then re-assemble the protector (Tool 126) to No.5 pump case and/or the protector (Tool 127) to No.1 pump case.

(2) Assemble the pins to the pressure pump case.

- (a) Place the straight pins (5-150) into a freezing agent for 10 minutes.

SUB-ASSEMBLY

**72-65-00**

Page 503

Jul 1/75

OLYMPUS 593

MK.610-14-28

OVERHAUL

(b) Place the pressure pump case on the bench, then remove the pins from the freezing agent and tap the pins into the locations in the case. Ensure the pins are assembled to the full depth of the holes in the case.

(c) Remove the protector, from the pressure pump case flange, then screw the hollow pin (5-140) onto the driver (Tool 128, pre SB.72-18 or Tool 1971, SB.72-18) and tap the pin into the location in the pressure pump case flange.

NOTE: If the pin cannot be assembled in this manner, it may be necessary to shrink the pin in a freezing agent for approx. 5 minutes.

(d) Remove the driver from pin and re-assemble the protector to the pressure pump case flange.

### 3. Check Bush Alignment

NOTE: This procedure is only applicable if one or more of the pump cases are new items or if repair work has been carried out on the bushes.

#### A. Check Bush Alignment of Scavenge Pump Cases.

(1) Assemble the holding fixture (Tool 112) to a Hydra-clamp and secure with two slave bolts.

NOTE: The illustrations show fixtures (Tool 112) with either four or two assembly studs. No difference in the assembly sequence is involved, and where reference is made to four spacers etc., the use of two is similarly implied.

(2) Remove the protector from No.4 scavenge pump case, then assemble the case to the fixture (Ref. Fig.502).

(3) Remove the protector from No.5 scavenge pump case, then assemble the case to No.4 scavenge pump case so that its gear pockets are uppermost and in line.

NOTE: The build sequence is shown in Fig.503 in the inverted state.

(4) Remove the protector from No.2/3 scavenge pump case, then assemble the case to No.5 scavenge pump case, with its gear pockets uppermost and in line.

(5) Remove the protector from No.1 scavenge pump case, then assemble the case to No.2/3 scavenge pump case with its gear pockets uppermost and in line.

OVERHAUL

- (6) Remove the alignment pin (Tool 4) from its container (Tool 114) and insert the alignment pin so that its larger diameter is located in the bushes, nearest to the Hydraclamp, of the four scavenge pump cases (Ref. Fig.503).
- (7) Remove the protector from the CB scavenge pump case, then assemble the case over the alignment pin, to No.1 scavenge pump case.
- (8) Secure the cases to the fixture with four spacers (Tool 117), washers and nuts.
- (9) Invert the unit, then insert the alignment pin (Tool 3) through the bush in No.4 scavenge pump case to locate in the bushes of all of the scavenge pump cases.
- (10) Ensure that both alignment pins rotate freely.
- (11) Withdraw the alignment pin (Tool 3) and invert the unit.
- (12) Remove the nuts, washers and spacers securing the scavenge pump cases to the holding fixture, then remove the cases, as a unit, from the fixture.

NOTE: The holding fixture may be left in position on the Hydraclamp for use during the assembly of the scavenge pumps.

- (13) Screw three mechanical pullers (Tool 1021) through the threaded extraction holes in No.4 scavenge pump case to lift the case from over the dowels of the scavenge pumps.

CAUTION: WHEN USING THE PULLERS TO DISMANTLE THE PUMP CASES, ALWAYS START AT NO.4 SCAVENGE PUMP CASE AND WORK THROUGH TO THE CB SCAVENGE PUMP CASE. DAMAGE WOULD BE CAUSED TO THE FACES OF THE PUMP CASES IF THE REVERSE SEQUENCE WERE USED.

- (14) Withdraw the remaining alignment pin from the pump cases and return both alignment pins to the container.
- (15) Using the pullers, disassemble No.5, No.2/3 and No.1 scavenge pump cases.

OVERHAUL

(16) Assemble the protectors to the scavenge pump cases.

- (a) Assemble the protector (Tool 119) to No.4 scavenge pump case.
- (b) Assemble the protector (Tool 126) to No.5 scavenge pump case.
- (c) Assemble the protector (Tool 125) to No.2/3 scavenge pump case.
- (d) Assemble the protector (Tool 127) to both No.1 and CB scavenge pump cases.

NOTE: If the procedure under para.4.B. is to be carried out it is not necessary to assemble the protector to the CB case.

B. Check Bush Alignment of Pressure Pump Case.

- (1) Place the pressure pump case on the bench with its flange face uppermost, then assemble the CB scavenge pump case to the pressure pump case over the dowels.
- (2) Remove the alignment pin (Tool 4) from the container (Tool 114), then insert the alignment pin, smaller diameter first, through the pressure pump driving gear bush into the corresponding bush in the pressure pump case (Ref. Fig.504).
- (3) Ensure the alignment pin rotates freely, then withdraw the alignment pin and return it to the container.
- (4) Screw three mechanical pullers (Tool 1021) through the threaded extraction holes in the CB scavenge pump case and lift the case from the pressure pump case.
- (5) Assemble the protector (Tool 127) to the CB scavenge pump case.

4. Assemble the Oil Pump

NOTE: The driving gears of No's.4, 5, 2/3 and CB scavenge pumps rotate clockwise as viewed from the top of No.4 scavenge pump casing and the driving gears of No.1 scavenge and the pressure pump rotate counter-clockwise, viewed from the same direction. On assembly of the gears to the casings, ensure that the gears are assembled in their original attitude as shown by the gear teeth engagement markings.

PRINTED IN ENGLAND

A. Assemble No.4 Bearing Scavenge Pump.

- (1) Assemble the holding fixture (Tool 112) to a Hydra-clamp and secure with two slave bolts.
- (2) Remove the protector from No.4 scavenge pump case, then assemble the case to the holding fixture (Ref. Fig.505) and secure with four spacers (Tool 115), washers and nuts.
- (3) Install the driving gear (3-410) with its longer journal uppermost, then install the driven gear (3-400) (Ref. Fig.506).
- (4) Remove the slave spindle (Tool 118) from its container (Tool 338), then insert the slave spindle through the driven gear, into the bush in the case.
- (5) Check the endfloat with a straight edge and feeler gauges, then check the backlash and radial clearance with feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check the figures obtained are within the limits quoted in the Fits and Clearances (FCS-469/479, 475, 470/480).
- (6) Remove the slave spindle and return it to the container, then remove the gears and apply lubricant 'A' to the gear teeth, end faces and journals. Reposition the gears in their original attitudes.
- (7) Remove the spacers, washers and nuts securing the case to the holding fixture.

B. Assemble No.5 Bearing Scavenge Pump.

- (1) Remove the protector from No.5 scavenge pump case, then assemble the case to No.4 scavenge pump case with its gear pockets uppermost and in line.
- (2) Secure with four of each of the spacers (Tools 111, 116 and 117), washers and nuts.
- (3) Install the driving gear (3-490) over the journal of No.4 scavenge pump driving gear, then install the driven gear (3-480) so that its journal locates No.4 scavenge pump driven gear (Ref. Fig.507).

- (4) Check the endfloat with a straight edge and feeler gauges, then check the backlash and radial clearance with feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check that the figures obtained are within the limits quoted in the Fits and Clearances (FCS-487/517, 483, 486/518).
- (5) Remove the gears and apply lubricant A to the gear teeth, end faces and journals, then replace the gears in their original attitudes.
- (6) Remove the nuts, washers and spacers securing the pump cases.

C. Assemble No.2/3 Bearing Scavenge Pump.

- (1) Remove the protector from No.2/3 scavenge pump case, then assemble the case to No.5 scavenge pump case with its gear pockets uppermost and in line.
- (2) Secure with four spacers (Tool 116), washers and nuts.
- (3) Install the driving gear (4-110A) over the journal of No.5 scavenge pump driving gear, then install the driven gear (4-100) journal through the bush (Ref. Fig.508).

NOTE: The gears are similar in shape, but the driving gear is distinguishable by its slightly longer journal.

- (4) Check the endfloat with a straight edge and feeler gauges, then check the backlash and radial clearance with feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check that the figures obtained are within the limits quoted in the Fits and Clearances (FCS-493/512, 503, 491/514).
- (5) Remove the gears and apply lubricant 'A' to the gear teeth, end faces and journals, then replace the gears in their original attitudes.
- (6) Remove the nuts, washers and spacers securing the pump cases.

D. Assemble No.1 Bearing Scavenge Pump.

- (1) Remove the protector from No.1 scavenge pump case, then assemble the case to No.2/3 scavenge pump case, with its gear pockets uppermost and in line.

- (2) Secure with spacers (Tool 111), washers and nuts.
- (3) Install the driving gear (4-170) so that its splined shaft locates in the driven gear of No.2/3 scavenge pump, then install the driven gear (4-180) over the journal of No.2/3 scavenge pump driving gear (Ref. Fig.509).

NOTE: The position of the driving and driven gears has now been reversed to direct the drive to the pressure pump gears.

- (4) Check the endfloat with a straight edge and feeler gauges, then check the backlash and radial clearance using feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check that the figures obtained are within the limits quoted in the Fits and Clearances (FCS-497/507, 502, 495/509).
- (5) Remove the gears and apply lubricant A to the gear teeth, end faces and journals, then replace the gears in their original attitudes.
- (6) Remove the nuts, washers and spacers, then carefully remove the scavenge pump assembly from the holding fixture and place it to one side on the bench.
- (7) Remove the holding fixture from the Hydraclamp.

E. Assemble the CB Scavenge and Pressure Pumps.

- (1) Assemble the holding fixture (Tool 852) to the Hydraclamp and secure it with two slave bolts.
- (2) Assemble the pressure pump case to the holding fixture (Ref. Fig.510) leaving the flange protector in position. Secure the case to the fixture with slave nuts and washers.
- (3) Install the driving gear (4-300) in the pressure pump case with the splines upwards, then install the driven gear (4-280) and insert the headed pin (4-200) through the driven gear into the bush of the case.
- (4) Check the endfloat using a straight edge and feeler gauges, then check the backlash and radial clearance using feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check that the figures obtained are within the limits quoted in the Fits and Clearances (FCS-465/468, 462, 459/464).

- (5) Withdraw the pin from the driven gear, then remove the gears and apply lubricant 'A' to the gear teeth, end faces and journals. Replace the gears in their original attitudes.
- (6) Remove the protector from the CB scavenge pump case, then place the case on a clean, flat, surface, with its gear pockets uppermost.
- (7) Install the gears (5-130) in the CB scavenge pump case.

NOTE: The two gears are identical, but should be assembled in their original attitude as shown by the gear teeth engagement markings. The driving gear rotates counter-clockwise as viewed on top of the gear pockets.

- (8) Check the endfloat using a straight edge and feeler gauges then check the backlash and radial clearance using feeler gauges (Ref. Fig.506). Take measurements at several positions to obtain mean clearances, then check the figures obtained are within the limits quoted in the Fits and Clearances (FCS-448/454, 452, 449/453).
- (9) Remove the gears from the CB scavenge pump case, apply lubricant A to the gear teeth, end faces and journals, then transfer the gears, in their original attitude to the locations in the pressure pump case.
- (10) Assemble the CB scavenge pump case to the pressure pump case to locate the pressure pump and CB scavenge pump gear journals in the bushes.

NOTE: Figure 511 shows the CB scavenge pump case assembled to the pressure pump case with the headed pin in position.

- (11) Insert the headed pin (4-200) through the CB scavenge pump case and pressure pump driven gear into the bush in the pressure pump case. Locate the eccentric head of the pin into the location in the CB scavenge pump case.

NOTE: If the pin is a tight fit it may be necessary to shrink it in a freezing agent for approx 5 minutes prior to assembly.

OVERHAUL

F. Assemble the Scavenge Pumps to the Pressure Pump (Ref. Fig.511).

- (1) Rotate the Hydraclamp to position the pressure pump case in a vertical plane, then insert the quill shaft (3-500) to line up the splines of the scavenge pump driving gears, so that the smaller end of the quill shaft protrudes from No.1 scavenge pump gear.
- (2) Insert the turning key (Tool 131) through No.4 scavenge pump driving gear, then carefully offer the scavenge pump cases to the pressure pump and CB cases so that the splines of the pressure pump driving gear enter the driving gear of No.1 scavenge pump and the splines of the quill shaft enter the driving gear of the CB scavenge pump. Rotate the turning key to engage the splines, then push the scavenge pump assembly fully home.

NOTE: The turning key must be fully engaged to ensure that the quill shaft engages the CB scavenge pump gear.

- (3) Return the unit to a horizontal position and, using the turning key, rotate the gears to ensure freedom of rotation, then remove the turning key.

NOTE: Do not invert the unit as the quill shaft will fall out of engagement.

G. Assemble the Sediment Strainer (Ref. Fig.512).

- (1) Assemble the holder (Tool 132) to a vice, then assemble the sediment strainer (3-60) to the sleeve (3-50) and insert them into the holder to locate the peg of the holder into the slots in the strainer.
- (2) Screw the jet (3-40) into the strainer and tighten using a tommy bar (Tool 1969).
- (3) Insert the strainer assembly into its location in No.4 scavenge pump case with the jet uppermost. If necessary tap into position using the driver (Tool 1479).
- (4) Place the cover (3-30) over the strainer, apply lubricant 'A' to the two short bolts (3-10) and the externally relieved bolt (3-20), then install the bolts to secure the cover. The bolts should only be hand-tight at this stage.

H. Assemble the Check Valve (Ref. Fig.513).

- (1) Assemble the spring (3-100) to the boss of the check valve (3-110), then assemble these to the cover (3-80). If a distance piece (3-90) was previously used, this should be inserted between the spring and the cover.
- (2) Offer the check valve assembly to its location in No.4 scavenge pump case, then apply lubricant 'A' to the four bolts (3-70) and install the bolts to secure the cover. The bolts should only be hand-tight at this stage.

I. Secure the Pump Casings.

NOTE: The identification and location of the retaining bolts and washers is given in Table 501. The positions for installing the bolts and washers, also the torque-tightening sequence, is shown in Fig.514.

- (1) Position the load spreading washers as shown, then apply lubricant 'A' to the bolts and install the bolts to secure the pump cases.
- (2) Torque-tighten the bolts in the sequence shown (Ref. Fig.514) between 67 and 73 lbf in. (7,6 and 8,2 N.m), checking that the run-down torque is not less than 3,5 lbf in. (0,4 N.m).
- (3) Using the turning key, rotate the gears to ensure freedom of rotation.

## J. Assemble the Relief Valve (Ref. Fig.515).

- (1) Check that the valve (5-70) is a free sliding fit in the valve guide (5-80), then remove the valve.
- (2) Apply lubricant 'A' to the inside and outside diameters of the valve guide, place it headed end first on the drift (Tool 1970), then insert the guide into the relief valve location in the pressure pump casing, lightly tapping the drift if necessary.
- (3) Apply lubricant 'A' to the outside diameter of the valve (5-70), then insert the valve into the valve guide.
- (4) Apply lubricant 'A' to the threads of the adjuster, (5-40), then screw the adjuster through the retainer sleeve (5-60) until the threads of the adjuster protrude.
- (5) Apply lubricant 'A' to the threads of the retainer sleeve, then install the torque adaptor assembly (Tool 3155) over the sleeve so that it locates in the slots.

NOTE: The torque adaptor set (Tool 3155) contains a tap plug which may be used to clean the threads of the retainer sleeve prior to assembly. If this is used, care must be taken to ensure that no metallic particles enter the relief valve.

- (6) Insert the spring (5-50) into the adjuster, then screw the adjuster and retainer sleeve into the relief valve location, ensuring that the spring is located in the valve. Torque-tighten the retainer sleeve between 290 and 310 lbf in. (33 and 35 N.m), then unscrew and remove the torque adaptor assembly (Tool 3155).
- (7) Screw the locknut (5-30) onto the adjuster, then using the adjuster tool (Tool 1593), screw the adjuster so that two threads are showing beyond the locknut. Torque-tighten the locknut between 170 and 190 lbf in. (19,2 and 21,5 N.m).

- (8) Insert corruplus seal (5-20) to the groove in the cap (5-10). Screw the cap onto the retainer sleeve and torque-tighten between 170 and 190 lbf in. (19,2 and 21,5 N.m) using the crowfoot wrench (Tool 1579 pre-SB.72-8 or Tool 1972, SB.72-8).

NOTE: This cap will be wire-locked after engine test.

- K. Install the Scavenge Filters and Magnetic Plugs (Ref. Fig.516 and 517).

NOTE: There are three scavenge filters, each incorporating a magnetic plug. The following procedure for assembly and installation is identical for each filter.

- (1) Assemble the scavenge filters and magnetic plugs (Pre SB.0L.593-72-9036-419) (Ref.Fig.516).
- (a) Assemble the spring (2-120) to the inner strainer (2-100) so that the end coil of the spring enters the location groove in the strainer.
- (b) Assemble the inner strainer to the outer strainer (2-110), then screw the body (2-90) into the strainer unit until the threads disengage.
- (c) Apply lubricant 'A' to the threads of the strainer body, then assemble the magnetic plug (2-70) where applicable, to the strainer body.
- (d) Assemble the two remaining scavenge filters in the same manner.

CAUTION: IT IS OF THE UTMOST IMPORTANCE TO ENSURE THAT ALL MAGNETIC PLUG ASSEMBLIES ARE FULLY TORQUE TIGHTENED ON ASSEMBLY, ALSO, WHEN FITTING ASSEMBLIES MODIFIED TO SB.0L.593-72-9036-419 STANDARD A SERVICEABLE 'O' SEAL MUST BE FITTED. FAILURE TO DO THIS CAN RESULT IN OIL LEAKAGE IN FLIGHT WHICH MAY NOT BE APPARENT DURING GROUND CHECKS/RUNNING.

- (2) Assemble the scavenge filters and magnetic plugs (SB.0L.593-72-9036-419) (Ref.Fig.517).
- (a) Assemble the spring (2-120) to the inner strainer (2-100) so that the end coil of the spring enters the location groove in the strainer.

- (b) Assemble the inner strainer to the outer strainer (2-110), then screw the body (2-90) into the strainer unit until the threads disengage.
  - (c) Apply lubricant 'A' to the threads of the strainer body. Install a sealing ring (2-34) on the magnetic plug (2-70B), then assemble the magnetic plug to the strainer body.
  - (d) Assemble a sealing ring (2-36) to the strainer body.
  - (e) Assemble the two remaining scavenge filters in the same manner.
- (3) Install the scavenge filters (Ref. Fig.516).

- (a) Rotate the oil pump on the Hydraclamp so that it is almost vertical.

NOTE: Do not turn the oil pump further than the vertical position or the quill shaft will fall out of engagement.

- (b) Enter the strainer into the location in the base of the pressure pump case, then press the strainer unit in to compress the spring.
- (c) Apply lubricant 'A' to the threads of the retaining ring (2-80), then screw in the retaining ring, with the wire-lock holes outwards, to secure the strainer unit.
- (d) Using the wrench (Tool 1478) torque-tighten the retaining ring to between 60 and 70 lbf ft (82 and 94 N.m), then torque-tighten the magnetic probe/plug to 30 lbf ft (40,7 N.m).
- (e) Install the two remaining scavenge filters in the same manner, torque-tightening the retaining rings between 60 and 70 lbf ft (82 and 94 Nm), and the magnetic probes/plugs to 30 lbf ft (40,7 Nm).

NOTE: The retaining rings will be wire-locked after engine test.

MK.610-14-28

sneema

OVERHAUL

L. Install the Pressure Filter (Ref.Fig.516 and 517).

**NOTE:** Para.(1) applies only if fine mesh filters to SB.72-49 are not supplied already assembled.

(1) Assemble the pressure filter (SB.72-49 only).

- (a) Insert the closed end of the inner filter element (2A-59) into the outer filter element, and insert the bolt (2A-55), lubricated with lubricant A, through the two elements from the inside.
- (b) Feed the spring (2A-54) with the closed coil towards the element over the bolt, and retain with a washer (2A-53) and nut (2A-52).
- (c) Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the nut between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(2) Assemble the filter to the case.

**NOTE:** If the strainer (2-50) is pre-SB.72-49 standard, ensure the maximum overall length is within 5.400 in.  $\pm$  0.010 in. (137,16 mm  $\pm$  0,25 mm). For those strainers in excess of this length refer to SB.72-112.

- (a) Screw the cover (2-40) onto the strainer (2-50) until the threads disengage (pre-SB.72-49), or screw the retainer assembly (2A-45) into the filter element until the threads disengage (SB.72-49).
- (b) On engines to SB.0L.593-72-9036-419, assemble a sealing ring (2B-32) to the cover (2B-45B).
- (c) Insert the filter assembly into the location in the base of the pressure pump case.
- (d) Apply lubricant 'A' to the threads of the retaining ring (2-30) or (2-30B) SB.72-27. Apply pressure to the filter, to compress the spring, and secure with the retaining ring. On pumps pre-SB.72-27 ensure the angled locking-wire holes face outward.

OVERHAUL

- (e) Using the wrench (Tool 1478) torque-tighten the retaining ring between 125 and 135 lbf ft (170 and 183 Nm).
- (f) On engines Pre SB.0L.593-72-9036-419 only, apply lubricant 'A' to the threads of the plug (2-10) then assemble the plug with the seal (2-20) to the filter assembly and torque-tighten between 230 and 250 lbf in. (26 and 28 Nm) checking that for SB.72-49 standard only, that the run-down torque is between 14 and 120 lbf in. (1,6 and 14 Nm).

NOTE: The retaining ring and plug will be wire-locked after engine test.

- (g) Return the oil pump to a horizontal position.

M. Prepare for Despatch.

- (1) Assemble the cover to the negative G bleed location (Ref.Fig.516).
  - (a) Apply lubricant 'A' to the eight bolts (5-90) insert two of them through the bracket (5-100), then screw the eight bolts through the cover (5-110) and gasket (5-120) into the negative G bleed location in the pressure pump casing.
  - (b) Check that the run-down torque is not less than 3.5 lbf in. (0,4 N.m), then torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 Nm).
- (2) Insert the quillshaft (3-120) into the driving gear of No.4 scavenge pump.
- (3) Remove the oil pump from the holding fixture and place it in a suitable tray, then remove the holding fixture from the Hydraclamp.
- (4) The oil pump is now ready for assembling to the left-hand gearbox (Ref.72-62-00 Assembly).

FLIGHT PROFILES AND OPERATIONAL MONITORING -  
ENGINE GROUP 'A' PARTS

1. General

Certain engine parts, mainly those of the rotating assemblies, are subject to cyclic fatigue and a failure could hazard the safety of the aircraft. These are defined as group 'A' parts, identified by a serial number and subject to a mandatory life control procedure. The life limitations of the group 'A' parts are established by cyclic rig testing and examination of new and service-run parts and these limits must not be exceeded.

A. Datum Flight Profile.

The life limits are converted into equivalent flight cycles based on the rate of fatigue life usage determined from the datum flight profile shown in Figures 1 and 2.

The initial accounting factor for both subsonic and supersonic flight is taken as 1.0, and for touch and go is taken as 0.4 of the datum flight cycle.

B. Flight Profile Monitoring.

It will be the operators responsibility to define the flight profile which is representative of actual service operations over his entire route structure and to provide Rolls-Royce with the results in the form used for the flight datum profile in Figures 1 and 2.

This information should be provided at the completion of the first six months of operations and will contribute to any required changes in authorized lives, or the accounting factors for supersonic, sub-sonic and touch and go flights.

Periodically, at intervals not exceeding one year from the date of the first return, operators will repeat the check and provide Rolls-Royce with the updated information. Additionally, the check should be repeated at any time within this period if it is considered that the actual flight profile is no longer representative of the operation.

## 2. Life Control Procedures

Rolls-Royce will identify the group 'A' parts and provide the relevant cyclic lives in Chapter 5-10-03.

It is the responsibility of the operator to monitor service lives of group 'A' parts and ensure that the approved life limits are not exceeded. When an engine, module or part is returned to a repair facility, it is the responsibility of the operator to record on the relevant documentation the total flying hours and number of flight cycles accruing to the engine, module or part. The Repair Agency will take responsibility for identifying the parts life situation in respect of engines, modules, returned to the Operator after overhaul, or re-work.

LIVES OF GROUP 'A' PARTS1. General

Group 'A' parts have maximum approved lives which are mandatory and must not therefore be exceeded in service.

**CAUTION:** IT IS POSSIBLE TO REACH THE MAXIMUM APPROVED LIFE OF A PART IN AN ENGINE/MODULE BETWEEN REWORKS OR BEFORE SOME OTHER REASON REQUIRES REMOVAL OF AN ENGINE/MODULE. IT IS THE OPERATOR'S RESPONSIBILITY TO ENSURE THESE APPROVED PART LIVES ARE NOT EXCEEDED.

The lives are expressed in terms of "flight cycles" based on a Datum Flight Profile. The definition of a "flight cycle" is: A normal take-off to landing according to the Datum Flight Profile for the engine type, see Chapter 5-10-01.

2. Life Limits

An asterisk (\*) will be positioned against a limit to denote a finite life. Lives not so marked are likely to be increased as testing and service experience permits and should not therefore be used for long term provisioning or budget purposes.

CHAPTER 70STANDARD PRACTICES

## 1. General.

- A. Standard practices applicable to a particular engine topic, e.g. Disassembly, Cleaning, or Assembly, are included in Chapter 72-09-00 of the topic.
- B. Standard practices for Power Plant disassembly and assembly are included in Chapter 71-09-00.
- C. Standard practices contained in Chapter 70 are general in nature and apply to all topics.

## 2. References to T.S.D.594.

- A. The Rolls-Royce Overhaul Process Manual T.S.D.594 has been deleted from service and replaced by the Rolls-Royce Overhaul Process Manual T.S.D.594-J. This manual contains the same information but is compiled to meet the requirements in ATA 100 section 2-13-4.
- B. The processes in T.S.D.594 were compiled as follows:
  - (1) General
  - (2) Processing
  - (3) Details and Control of Solutions
  - (4) Materials
  - (5) Safety Precautions
- C. The processes in T.S.D.594-J are compiled as follows:
  - (1) Materials
  - (2) Details of Control of Solutions
  - (3) Safety Precautions
  - (4) General
  - (5) Processing

snecma

D. Application of Task Numbering System (Ref. Fig.1).

- (1) The TASK numbering system used in T.S.D.594-J is based on the Jet Engine Maintenance Task Oriented Support System (J.E.M.T.O.S.S.) requirement specified in ATA100 Specification, Section 2-13-4. The TASK and SUBTASK numbers of the manual are formulated for electronic data processing use; the format still allows the manual to be used in hard copy form.
- (2) The system uses an expansion of the existing ATA100, 3-element numbering system, to which fourth, fifth and sixth elements have been added. The content of this manual is considered to be Standard Practices, therefore the ATA100, 3-element number used is 70-00-00. The fourth element numerically defines the function being performed, the fifth element defines the Overhaul Process, the sixth element is provided to create a unique number for SUBTASKS of the TASK. The sixth element is also used alpha-numerically to identify differences between methods and techniques of the Overhaul Process, TASK/SUBTASK accomplishment (see Fig.1).

E. Appendices and Supplements.

- (1) An appendix will be allocated the alpha-numeric sixth element at TASK level e.g. 70-00-00-300-302-A01 is an appendix to TASK 70-00-00-300-302.
- (2) A supplement will be allocated the alpha-numeric sixth element at TASK level, e.g. 70-00-00-300-301-S01 is a supplement to TASK 70-00-00-300-301.

F. How to refer from T.S.D.594 to T.S.D.594-J.

(1) When a reference to T.S.D.594 is made, the reference is either the complete Overhaul Process, i.e. O.P.110, or to a specific paragraph to be actioned, i.e. O.P.101 Para.2.B. When this occurs refer to T.S.D.594-J as follows:

(a) When the complete Overhaul Process is called out refer to the TASK (TASK means complete process) in T.S.D.594-J as follows:

T.S.D.594 O.P.101 =  
TASK 70-00-00-100-101 (T.S.D.594-J O.P.101)

(b) When a specific paragraph is to be actioned refer to the SUBTASK (SUBTASK means part of process) in T.S.D.594-J as follows:

T.S.D.594 O.P.101 Para.2.B. =  
SUBTASK 70-00-00-110-101-001 (T.S.D.594-J O.P.101)

(c) When a reference is made to an appendix of an Overhaul Process, refer to the TASK in T.S.D.594-J as follows:

T.S.D.594 O.P.409 App.2 =  
TASK 70-00-00-300-409-A02 (T.S.D.594-J O.P.101)

(d) When a reference is made to a supplement of an Overhaul Process, refer to the TASK in T.S.D.594-J as follows:

T.S.D.594 O.P.409 Supp.12 =  
TASK 70-00-00-300-409-S12 (T.S.D.594-J O.P.101)

(e) A full reference list from T.S.D.594 Overhaul Process and paragraph to T.S.D.594-J TASK and SUBTASK is contained in the 'HOW TO USE' section of T.S.D.594-J Engine Overhaul Processes Manual.

LIFE LIMITATIONS AND STORAGE CONDITIONS FOR FLEXIBLE  
RINGS, HOSES AND RUBBER COMPONENTS

1. General

- A. Vulcanised rubber components made to well controlled specifications, properly packaged and stored under good conditions, will remain in a serviceable condition for many years. However, some rubbers are more susceptible to degradation by such factors as heat, light, ozone, oxygen, humidity etc., and therefore a system of storage control is necessary to ensure serviceability of components.
- B. Components are marked or labelled with the following information:
- (1) Part number.
  - (2) Material specification and/or polymer description.
  - (3) Cure date.
  - (4) Life grouping.
  - (5) Quantity in package.
  - (6) Batch number.
  - (7) Manufacturer's identity.
- C. The shelf life quoted applies only to new and uninstalled parts stored under the specified conditions.
- D. The age of the component is calculated from the end of the three-month period (quarter) in which it was manufactured (cured).
- E. The cure date is marked on the component or on its label with the quarter and year of manufacture. For example, a cure date marked 2Q87 indicates the second quarter (April, May, June) of 1987.

In addition, hoses may be marked with an extra four figures indicating the length or batch number. For example, 01012Q87 indicates the 101st length or batch cured in the second quarter of 1987.

- F. Components must be inspected and/or tested immediately before final assembly.

## 2. Component Life

A. Components are divided into three Life groups according to material specification.

(1) Group A - moderate susceptibility to deterioration by ageing:

natural rubber  
polybutadiene  
polyisoprene  
polyurethane  
styrene-butadiene

Initial life from the cure date is 5 years. The subsequent life is unlimited, subject to satisfactory inspection (Ref. paragraph 4.) of a sample of the oldest stock at least every 2 years.

(2) Group B - low susceptibility to deterioration by ageing:

acrylonitrile-butadiene (nitrile)  
blend of acrylonitrile-butadiene and  
polyvinyl chloride (nitrile/PVC)  
epichlorhydrin  
polyacrylate  
polychloroprene (neoprene)  
polyisobutylene-isoprene (butyl)

Initial life from the cure date is 7 years. The subsequent life is unlimited, subject to satisfactory inspection (Ref. paragraph 4.) of a sample of the oldest stock at least every 3 years.

(3) Group X - no periodic inspection required:

chlorosulphonated polyethylene  
ethylene-propylene  
fluorocarbon  
fluorosilicone  
silicone

There is no life limit, but a cure date may be marked to assist stock monitoring.

### 3. Storage Conditions

- A. Maintain rubber and synthetic rubber parts in good condition and ensure maximum shelf life by careful attention to storage conditions. Store parts under conditions which provide the maximum possible protection against the effects of strain, direct sunlight, ozone, moisture, excessive circulation of air, extremes of temperature, physical damage and contamination by fuels, oils, greases, or solvents. If the parts are supplied packed in envelopes, plastic bags or cartons, they should be kept in this condition until required for service. Do not allow direct contact between rubber parts and metals (especially containers made from copper).
- B. Store parts in a relaxed position free from tension and, wherever possible, in their normal shape. Avoid excessive vertical stacking of parts as this can cause permanent distortion of the lower layers. Store flexible hoses in straight lengths, wherever possible, as 'coiling' produces tension in the outside of each coil and increases the risk of ozone cracking.
- C. Provide sufficient ventilation to prevent condensation, but prevent currents of air from coming into contact with the stored parts. Avoid, as much as possible, sources of ozone such as mercury vapour lamps, electrical machinery and an excess of outdoor air which, in temperate climates, always contains ozone. Ensure that parts are shielded from direct sunlight.
- D. Store lip-type seals in such a manner that damage and distortion to the sealing edge is avoided, and do not tie labels directly to the seals. Do not fit sealing rings to ferrules or bobbins until immediately before installation into an engine or unit as stretching and exposure to light can cause deterioration.
- E. Maintain storage temperature within the preferred range of 15 to 21 deg.C. (59 to 70 deg.F.) with a minimum of 5 deg.C. (41 deg.F.) and a maximum of 25 deg.C. (77 deg.F.), and an air relative humidity below 75 per cent. Store parts at least 3 feet from any unscreened source of heat.
- F. Avoid excessive shelf storage time by relating level of stocks to rate of use and by issuing parts on an 'age' basis, that is, oldest items, as shown by cure date, first.

STANDARD PRACTICES

**70-00-01**Page 3  
Dec 1/87

**OLYMPUS 593**

MK.610-14-28  
OVERHAUL

4. Inspection of Parts

- A. Examine parts for signs of 'ageing' or degradation due to oxidation; this is shown by surface cracks and deterioration. To check, flex the part gently and discard if cracks are present before or after flexing.
- B. Do not automatically discard parts due to the presence of a white or coloured 'bloom' on their surface. Such blooms are often desirable anti-ageing layers and originate from the anti-oxidants used in high-grade rubber.
- C. Examine all parts for the following; discard if faulty:
  - (1) Permanent distortion, flats and other obvious defects.
  - (2) Tackiness or surface hardening or softening.
  - (3) Blistering, peeling or cracks when rubber is extended or flexed.
  - (4) Chafing of outer coverings and corrosion of, or damage to, end fittings of hose assemblies and cable harnesses.
  - (5) Corrosion of metal elements in bonded rubber-to-metal assemblies.
  - (6) Obstruction of the bore (flexible hoses).
- D. Pressure test flexible hoses as instructed in Chapter 71-70-00 Testing. If it is essential to fit a flexible hose when no facilities for pressure testing exist, then the hose must be removed for testing at the first available opportunity. On completion of pressure testing, drain the hose, blow through with clean air and seal the ends with blanks.
- E. All samples withdrawn for testing and/or inspection and found to be satisfactory, must be repackaged to the original specification before being returned to stores.

**INSPECTION/CHECK POLICY - REPORTING OF POTENTIAL SAFETY ISSUES****1. Potential Safety Issues Found During Engine Overhaul**

A. The following list is intended to provide guidance during engine overhaul for the reporting of potential safety issues. The list may not cover all potential safety issues for a given engine type and consideration should also be given to any condition which the overhaul organisation believes may be safety significant.

- (1) Failure, cracking, burning, distortion or excessive heat discolouration of any disc, spacer, main engine shaft or engine mount.
- (2) Corrosion, wear or damage, resulting in rejection to manual limits and which is outside existing experience, on any disc, spacer, main engine shaft or engine mount.
- (3) Any holing, cracking, burning, corrosion or bulging of engine cases.
- (4) Failure or cracking of major parts of the engine structure.
- (5) Evidence of fire, or a condition which is likely to result in fire (for example, failure or major distress to a fuel or oil pipe).
- (6) Failure or excessive blockage of fuel spray nozzles.
- (7) Conditions which have resulted, or may result in, distortion, loss or separation of major parts of the combustion system.
- (8) Failure or seizure of a mechanical emergency shut down device.
- (9) Any test failure producing any of the conditions listed above.
- (10) Damage to electrical harnesses, connectors and EECU mountings.

*sneema*

(11) Engine conditions which do not match mandatory requirements, for example:

- Installed Time Limited Parts beyond their declared lives
- Inconsistency between engine hardware and engine records

(12) Failure to implement mandated modifications.

(13) Any other engine condition found during overhaul, build or test which the overhaul organisation consider may adversely affect safety or have safety implications for other engines.

(14) The discovery of any unapproved parts.

(15) Evidence of any previous miss-assembly.

OVERHAULCHAPTER 71POWER PLANTTABLE OF APPROVED REPAIR SCHEMES

The following Repair Schemes have been approved by CAA/DGAC.

<u>Chapter/Section</u>	<u>Repair No.</u>	<u>Title</u>	<u>Salvage No.</u>
71-20-00	1	Engine mounting trunnions. Removal of cracks in flange by blending and polishing.	B.510768
	2	Engine Mounting Trunnions - Removal of corrosion from front and rear flange mounting holes.	B.513506
	3	Trunnion, Mounting. Restoration of mounting trunnion holes by nickel plating.	B.516368
71-32-01	1	Heat Shields, CCOC. Repair of fretting and cracking by welding and patching.	B.513550
71-32-02	1	Heat Shields, Exhaust Diffuser. Repair of fretting and cracking by welding and patching.	B.513551
71-51-01	1	Electrical Cables. Damaged areas repaired by splicing wrapping and shrink sleeving.	B.493642A-N
71-79-02	1	Tubes, oil drain. Repair of fretting/damage by inert gas arc welding.	B.514566

## TUBES AND ACCESSORIES - DISASSEMBLY

### TABLE OF CONTENTS

Para.	Page
1. General ... ..	101
2. Transfer the Engine from the Transit Trolley to Horizontal Stand ... ..	106
3. Drain the Oil System... ..	106
A. Drain Oil Tank ... ..	106
B. Left-hand Gearbox ... ..	107
C. Right-hand Gearbox ... ..	107
4. Drain the Fuel System ... ..	107
5. Remove the Air Intake Fairing and Damper Spring ... ..	108
6. Remove the Vibration Transducer ... ..	108
7. Remove the LP Rotor Shaft Front Cover and Bearing Housing Cover ... ..	108
8. Remove the Exhaust Diffuser Heatshield - Lower Panel ... ..	109
9. Remove the Reheat Igniter ... ..	109
10. Remove the Reheat Flame Detector... ..	109
11. Remove the Reheat Injection System ... ..	112
12. Remove the Jet Pipe Thermocouple Harness and Lead-out ... ..	112A
13. Remove the Rear Insulation Blanket and End Cover in the Exhaust Diffuser ... ..	113
14. Remove the Engine from the Horizontal Stand and Install in the Vertical Build Stand ... ..	113
15. Remove the Air Starter Air Venting Tubes ... ..	114
16. Remove the HE Ignition Unit.. ... ..	114
17. Remove the Front Bearing Centre and Rear Vent Tubes..	115
18. Remove the Air Overheat Warning Thermocouples ... ..	115
A. Thermocouple and Lead-out, HP Compressor Delivery Air ... ..	115
B. Remove the Thermocouples and Junction Boxes, Intermediate Case Bearing and HP Compressor Rear Labyrinth Seal ... ..	115
C. Remove Turbine Cooling Air Thermocouples and Lead-outs ... ..	116
D. Remove the Thermocouple, LP and HP Turbine Bearing Vent CCOC Elbow ... ..	116
E. Remove the Thermocouple, LP Turbine Bearing ... ..	116
F. Remove the Termination Junction Box and Brackets ... ..	116

Para.	Page
19. Remove the Fuel Drain Tubes Overboard Spill ...	117
20. Remove the Engine Fuel System Seal Drains Tubes ...	117
21. Remove the Fuel Drains Tube, Dump Valve to Drains Tank ...	120
22. Remove the Anti-icing System ...	121
A. Pressure Switch and Tube ...	121
B. Air Valve and Associated Tubes ...	121
23. Remove the Electrical Tray... ...	122
24. Remove the Reheat Fuel Feed Tube... ...	122
25. Remove Air Ducts and Vent Tubes ...	122
A. Ducts and Tubes, CCOC to Exhaust Diffuser Right-hand Bottom of Engine ...	122
B. Ducts and Tubes, CCOC to Exhaust Diffuser Left-hand Bottom of Engine ...	122
26. Remove the Cooling Air Tubes, LP and HP Turbine Bearings ...	123
A. Rear Tube, Turbine Shroud Elbow to Right-hand HP Casing ...	123
B. Forward Tubes, Intermediate Casing to Exhaust Diffuser Right-hand Side ...	123
27. Remove Oil Tubes, Pump to LP and HP Compressor Thrust Bearings, Oil Failure Warning... ...	124
28. Remove the Oil Scavenge and Feed Tubes, LP and HP Thrust Bearings, Bearings to Pump ...	124
A. Scavenge Tube ...	124
B. Feed Tube ...	124
29. Remove the Hydraulic Pump Drain Tubes, Seal Space to Oil Tank Overboard Vent ...	125
30. Remove the Electrical Harness Support Bracket ...	125
31. Remove Oil Scavenge Tubes, Oil Pump Housing to HP Compressor Diffuser Case, LP and HP Turbine Bearings ...	126
A. LP Turbine Bearing to Pump Tubes ...	126
B. HP Turbine Bearing to Pump Tubes ...	126
32. Remove Fuel Tubes ...	127
A. Fuel Outlet, Distribution and Dump Valve to FCU Tube Union ...	127
B. Fuel Feed, Adapter Block and Engine Flowmeter to Distribution and Dump Valve ...	127
33. Remove Fuel Return Tube - Drains Tank to the First Stage Pump/Recirculation Valve ...	128
34. Remove the First Stage Pump and Control Unit Gland Drain Tube to the Second Stage Pump Drain ...	129
35. Remove the Second Stage Pump Air/Fuel Drain Tube ...	129
36. Remove the Fuel Tube, FCU and Reheat Control Unit Return to First Stage Pump Inlet Elbow ...	129
37. Remove the Fuel Tube FCU and Reheat Control Unit to Three-way Connector ...	129

**TUBES AND ACCESSORIES - DISASSEMBLY****1. General**

**WARNING:** IF CONTAMINATION OF THE ENGINE BY DANGEROUS SUBSTANCES IS SUSPECTED, HEALTH AND SAFETY PRECAUTIONS MUST BE OBSERVED. THAT IS, DISASSEMBLY OF THE ENGINE MUST BE CARRIED OUT IN A CONTROLLED ENVIRONMENT WITH AIR EXTRACTION/FILTRATION AND PERSONNEL WEARING SUITABLE PROTECTIVE CLOTHING/ APPARATUS.

- A. Prior to commencing the disassembly contained in this Chapter, ensure that the electrical harness, ignition lead-out etc. have been removed (Ref.71-00-02 Disassembly), and that the Standard Practices detailed in 71-09-00 are adhered to.
- B. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. This chapter details the procedures for draining the oil and fuel systems, the removal of the engine from the transport stand to the horizontal stand, and finally to the vertical build stand. Then follows the detailed procedures for the removal of all the tubes and accessories including the left and right-hand gearboxes.
- D. Throughout the text reference is made to Fig.112, 113 and 114 for the location of the accessories and tubes. Detailed illustrations of the clipping are not contained in this chapter, but if required, refer to 71-00-01 Assembly.
- E. On receipt of the engine it will be found that transportation blanks will be assembled to the engine as illustrated in Fig.101. These blanks must remain assembled, unless their removal is required for the disassembly of a tube or accessory. On removal of a tube or accessory, ensure that suitable blanks are assembled to the items, mounting faces etc. Suitable blanking as well as transportation blanks are listed in Table 101.
- F. During the removal of the magnetic plugs and filters, care must be taken that any particles or flakes are retained, and a thorough examination of them carried out by the inspection department to determine their source, and what future investigation and action is required.

2. Transfer the Engine from the Transit Trolley to Horizontal Stand

- A. Assemble the beam type sling (Tool 1248) to the top lifting points of the engine, intermediate casing/HP casing flange and the delivery case/CCOC flange (Ref. Fig.102).
- B. Support the weight of the engine with the crane and lifting sling.
- C. Remove the front engine supports from the LP case.
- D. Remove the pedestal clamps from the trunnion adapters.
- E. Lift the engine from the trolley.
- F. Adjust the engine lifting sling to ensure that the engine is hanging square in the horizontal and vertical planes.
- G. Position the horizontal stand (Tools 1265, 261, 808) under the engine.
- H. Lower the engine into the stand.
- J. Secure the trunnions with the pedestal clamps and the front supports to the LP case.
- K. Remove the lifting equipment.

3. Drain the Oil System

- A. Drain Oil Tank.
  - (1) Position a suitable container with a minimum capacity of 30 litres below the drain coupling.
  - (2) Detach the fill/drain coupling pressure cap, turn the locking ring and pull it downward to release the locking balls of the quick release couplings.

OVERHAUL

- (3) Arrange the tube end of the drain tube (Tool 1782) to deliver into the container. Engage the tube adapter with the coupling, this action opens the drain valve.
- (4) When oil ceases to drain from the tank disconnect the drain tool and replace the pressure cap.

B. Left-hand Gearbox.

- (1) Position a suitable container below the main oil pump.
- (2) Remove the screwed magnetic plug assembly from the drain valve and body assembly installed at the LP and HP compressor thrust bearings and gearbox scavenge filter location.
- (3) Arrange the tube end of the drain tube (Tool 1782) to deliver into the container. Remove the cap from the tube adapter and screw the tube adapter into the drain valve and body assembly, this action opens the drain valve.
- (4) When oil ceases to drain from the tank disconnect the drain tube and replace the magnetic plug.

C. Right-hand Gearbox.

- (1) Position a suitable container below the gearbox oil scavenge filter location.
- (2) Remove the screwed magnetic plug assembly from the drain valve and body assembly installed at the right-hand gearbox oil scavenge filter location.
- (3) Arrange the tube end of the drain tube (Tool 1782) to deliver into the container, remove the cap from the tube adapter and screw the adapter into the drain valve and body assembly, this action opens the valve.
- (4) When oil ceases to drain remove the drain tube, replace cap on the tube adapter and replace the magnetic plug. Remove oil containers.

4. Drain the Fuel System

- A. Position a suitable container under the fuel filter drain valve.

DISASSEMBLY

OVERHAUL

- B. Remove filter drain valve pressure cap. Assemble bleed tube (Tool 1783) to drain valve and drain fuel. Replace pressure cap.
  - C. Remove the container and dispose of the fluid.
5. Remove the Air Intake Fairing and Damper Spring  
(Ref.Fig.113 Item 94)
- A. Remove the Air Intake Fairing.
    - (1) Remove blanking cover from front of air intake.
    - (2) Slacken and remove the nuts securing the fairing using Tool 1629.
    - (3) Remove the air intake fairing.
  - B. Remove the Damper Spring (Ref.SB.72-8746-284).
    - (1) Unscrew the tapered end of the damper spring.
    - (2) Remove the damper spring from around the hollow of the air intake fairing plunged hole.
  - C. Remove the Damper Spring (Ref.SB.72-9005-409).
    - (1) Unscrew the tapered end of the damper spring.
    - (2) Remove the damper spring from around the hollow of the air intake fairing plunged hole.
    - (3) Remove and discard existing glass cloth tape.
6. Remove the Vibration Transducer (Ref.Fig.113 Item 93)
- A. Slacken and remove the nuts and bolts securing the transducer to the mounting.
  - B. Remove the transducer.
  - C. Remove the nuts, bolts and loop clamps securing the cable in the front bearing housing cover and to the intake flange assembly bracket.
  - D. Cut the cable and remove the wall mounting receptacle (Ref.77-33-01 Disassembly).

**OLYMPUS 593**MK.610-14-28 *sneema*

OVERHAUL

Printed in England

E. Remove the bracket and gland assembly securing the cable in the intake flange assembly.

F. Remove the inner connector and cable from the bearing housing cover assembly (Ref.77-33-01 Disassembly).

7. Remove the LP Rotor Shaft Front Cover and Bearing Housing Cover (Ref.Fig.113 Item 92)

A. Slacken and remove the bolts retaining the bearing housing cover and bracket.

B. Remove the bracket and bearing housing cover using extractors (Tool 1668).

C. Slacken and remove the bolts securing the shaft cover.

D. Remove the shaft cover.

E. Assemble the jacking adapter (Tool 319) to the LP rotor shaft front.

(1) Remove the bolts securing the shaft cover in the LP rotor shaft.

(2) Remove the blanking plate.

(3) Install the adapter and secure in the LP shaft using the bolts retained in the adapter.

8. Remove the Exhaust Diffuser Heat Shield - Lower Panel

A. Slacken and remove the nuts, bolts, distance pieces, washers and mesh dampers securing the heat shield to the brackets.

B. Remove the heat shield from the engine.

C. Remove the bracket and tie from the brackets on the exhaust diffuser adapter flange and adapter flange connection.

9. Remove the Reheat Igniter (Ref.Fig.112 Item 91)

CAUTION : UNDER NO CIRCUMSTANCES MUST THE CABLE BE DISCONNECTED FROM THE IGNITION PLUG BODY.

A. Remove the bolts and keywashers securing igniter flange and shim to spherical joint flange.

OVERHAUL

- B. On engines to SB.74-3 standard remove the nut and bolt securing the igniter lead to the attachment bracket.
- C. Carefully withdraw igniter from reheat injection system and remove igniter and lead from engine.

10. Remove the Reheat Flame Detector (Ref.Fig.112 Item 90)

- A. Remove the nut and bolt retaining the loop clamp to the bracket at vane seven of the exhaust diffuser casing. Remove the loop clamp.
- B. Remove the nuts and bolts retaining the detector lead to the bracket on the CCOC/exhaust diffuser flange.
- C. On engines to pre S.B.77-10 and 77-11 standard, support flame detector, remove the four securing bolts and withdraw detector from the spherical joint flange.
- D. On engines to S.B.77-10 and 77-11 standard, slacken the pitot tube clamp assembly bolt and four bolts securing the flame detector. Support the detector, remove securing bolts and move the pitot tube bracket clear of the flange, then withdraw the detector.

11. Remove the Reheat Injection System (Ref.Fig.113 Item 89 and Fig.103)

- A. Disconnect the fuel supply tube from the spray ring elbow (Tool 1529).
- B. Slacken and remove the nut (Tool 1568).
- C. Remove the attachment ring from the end piece.
- D. On engines to pre S.B.77-10 and 77-11 standard, slacken and remove the bolts and keywashers retaining the bush to the spherical joint flange.
- E. On engines to S.B.77-10 and 77-11 standard, remove bush.
  - (1) Slacken the pitot tube clamp assembly bolt.
  - (2) Remove the bolts securing the bush and support bracket to the spherical joint flange.
  - (3) Move the clamp assembly and the support bracket clear of the flange and detach bush.

OVERHAUL

F. Remove the locking pins, grooved washers and pins securing the spray ring to the exhaust cone and remove the injection system.

G. Temporarily assemble the nut to the manifold end fitting.

12. Remove the Jet Pipe Thermocouple Harness and Lead-Out (Ref. Fig.113 Item 88 and 82)

A. Remove Lead-out.

- (1) Remove the bolts from the harness junction box cover at the lower left-hand side of the exhaust diffuser case, and detach cover.
- (2) Remove two nuts, lockwasher and plain washer from each junction box terminal post.
- (3) Remove two bolts and washers securing lead-out terminal block to junction box.
- (4) Remove cover from termination junction box cover on underside of CCOC case.
- (5) Remove the four bolts securing forward end of lead-out and test plug at junction box base.
- (6) Detach the pillar bolt and the two loop clamps securing lead-out to engine and carefully withdraw lead-out from junction box terminal posts.

NOTE: Retain the special nuts and bolts with the thermocouple junction box.

OVERHAUL

B. Remove Thermocouple Harness.

- (1) Remove the nuts and bolts securing the saddle, gasket and junction box to the diffuser case.
- (2) Remove the bolt securing the harness assembly to the exhaust diffuser inner flange.
- (3) Install the harness protector (Tool 1769) (Ref. Fig.103).

CAUTION: DO NOT SUPPORT THE HARNESS BY THE LEAD-OUT.

- (4) Remove the eight bolts securing harness to diffuser inner case and carefully remove the harness from engine.
- (5) Place the harness in the transportation container (Tool 1769). Remove the harness protector and secure container.

13. Remove the Rear Insulation Blanket and End Cover in the Exhaust Diffuser (Ref.Fig.113 Item 87)

- A. Remove the nuts and bolts securing the blanket and cover pre S.B.72-20 or remove the wire securing the blanket end cover S.B.72-20. Remove the end cover from the blanket halves.
- B. Remove the bolts securing the cover to the rear cover, then remove the cover complete with oil tube and transfer block.

14. Remove the Engine from the Horizontal Stand and Install in the Vertical Build Stand

- A. Release and remove the stand pedestal clamps from the left and right-hand trunnion brackets, ensure the trunnion bracket retaining pins are in position.
- B. Assemble the lifting sling (Tool 1175) to the front lifting points of the lifting beam (Tool 1176). Attach the beam to an overhead crane.
- C. Raise the beam and position over the engine, attach the two front shackles of the beam to the lifting points on the intermediate case/HP case flange.

DISASSEMBLY

Page 113

Feb 1/78

OLYMPUS 593

MK.610-14-28

OVERHAUL

- D. Remove the two retaining pins from the beam arms and assemble the arms to the left and right-hand trunnion brackets and secure with the retaining pins.
  - E. Support the engine weight with the crane and remove the horizontal stand front support from the LP case.
  - F. Assemble the lifting sling (Tool 1174) to a second crane and the lifting points of the lifting beam at the trunnion bracket locations.
  - G. Carefully manipulate the two cranes to lower the front and raise the rear of the engine until it hangs in the vertical position.
  - H. Check that the jacking pad of the build base (Tool 1244) is down out of position.
  - J. Lower the engine onto the base and clamp securely into position.
  - K. Remove all the lifting equipment and store on a mobile trolley (Tool 1314).
  - L. Adjust the jacking pad to support the LP shaft, turn the adjusting wheel on the build base raising the pad sufficiently to butt and support the adapter on the LP shaft.
  - M. Remove the left and right-hand trunnions from the engine mountings, refit to the stillage and secure with the pedestal clamps.
15. Remove the Air Starter Air Venting Tubes (Two rear tubes only) (Ref.Fig.113 Item 86)
- NOTE: The front tube which connects to the starter, will be loosely assembled or attached to the engine.
- A. Loosen the tubes union nuts of the centre and rear tube.
  - B. Remove the loop clamps securing the tubes.
  - C. Unscrew the tube union nuts and remove the two tubes.
16. Remove the HE Ignition Unit (Ref.Fig.113 Item 85)
- A. Remove the HE ignition leads from the unit.
  - B. Detach bonding lead lug from stud on unit.

- C. Remove the bolts, bonding lead and distance pieces and remove the ignition unit.

17. Remove the Front Bearing Centre and Rear Vent Tubes  
(Ref.Fig.113 Item 84)

- A. Loosen the centre tube union nut from the connector on the bottom of the engine near the engine identification plate.
- B. Loosen the union nuts of the rear tube which connects with the oil tank overboard vent.
- C. Remove the nuts, bolts and loop clamps securing the two tubes.
- D. Unscrew the tube unions and remove the tubes.

18. Remove the Air Overheat Warning Thermocouples

- A. Thermocouple and Lead-out, HP Compressor Delivery Air (Ref.Fig.113 Item 83).
  - (1) Loosen the thermocouple union in the delivery casing.
  - (2) Remove the termination junction box mounting cover.
  - (3) Remove the bolts securing the lead-out to the junction box.
  - (4) Remove the nuts, bolts and loop clamps securing the lead-out.
  - (5) Unscrew the thermocouple union nut and remove the unit from the engine.
- B. Remove the Thermocouples and Junction Boxes, Intermediate Case Bearings and HP Compressor Rear Labyrinth Seal (Ref. Fig.113 Items 80 and 81).
  - (1) Loosen the bolts securing the lead-outs, junction boxes and the thermocouple union nuts.
  - (2) Remove the nuts, bolts and loop clamps securing the HP compressor rear labyrinth seal lead-out.
  - (3) Remove the nuts, bolts and grooved clamps securing the HP compressor rear labyrinth seal and intermediate bearing thermocouples lead-outs.

OVERHAUL

- (4) Unscrew the HP compressor rear labyrinth seal thermocouple union nut and lead-out securing bolts and remove the thermocouple.
  - (5) Unscrew the intermediate bearings thermocouple union nut and lead-out securing bolts and remove the thermocouple.
- C. Remove the Turbine Cooling Air Thermocouples and Lead-outs (Ref.Fig.113 Item 79).
- (1) Remove the covers from the lead-out junction boxes.
  - (2) Remove the nuts and washers connecting the thermocouple leads to the lead-out junction boxes.
  - (3) Remove the bolts securing the thermocouples to the junction box and withdraw the thermocouples.
  - (4) Remove the bolts securing the lead-outs to the termination junction box and the pillar bolts securing lead-out junction boxes to the CCOC.
  - (5) Remove the clamps securing the lead-outs and remove lead-outs.
  - (6) Loosely assemble the covers to the lead-outs.
- D. Remove the Thermocouple, LP and HP Turbine Bearing Vent, CCOC Elbow (Ref.Fig.113 Item 78).
- (1) Remove the thermocouple union nut and junction box bolts.
  - (2) Remove the thermocouple.
- E. Remove the Thermocouple, LP Turbine Bearing (Ref.Fig.113 Item 77).
- (1) Remove the loop clamp securing the lead-out.
  - (2) Remove the bolts securing the lead-out to the termination junction box.
  - (3) Remove the thermocouple union nut and withdraw thermocouple.
- F. Remove the Termination Junction Box and Brackets (Ref. Fig.113 Item 76).
- (1) Remove the junction box from the support brackets.

OVERHAUL

- (2) Remove the brackets from the centre and right-hand support tube.

9. Remove the Fuel Drain Tubes, Overboard Spill (Ref.Fig.113 Item 75)

- A. Loosen the tubes union nuts, from the adapter on the LP case rear blow-off flange rearwards to the drains tank connection.
- B. Remove the nuts, bolts, clipnuts and loop clamps retaining the tubes.
- C. Unscrew the tube union nuts and remove the tubes.
- D. Remove the pipe closure nut from the adapter and the adapter from the bracket mounted to the LP case rear blow-off flange using spanner (Tool 1480).

20. Remove the Engine Fuel System Seal Drain Tubes (Ref.Fig.113 Item 74 and Fig.104)

- A. Loosen the tube union nuts, remove the loop clamps, unscrew the tube union nuts and withdraw the following tubes:
  - (1) Between the T-piece and the drains tank outlet elbow.
  - (2) Between the emergency dump valve and oil cooler.
  - (3) Between the T-piece and the emergency dump valve.
  - (4) Between the two T-pieces.
  - (5) Between the reheat flowmeter and starting pump.
  - (6) Between the T-piece and the reheat flowmeter.
  - (7) Between the second stage pump and T-piece.
  - (8) Between the three-way multiple connection and the second stage pump.
  - (9) Between the three-way multiple connection and the reheat flowmeter fuel filter.
  - (10) Between the fuel filter and the three-way multiple connection.
  - (11) Between the first stage pump and fuel filter.

- (12) Between the fuel inlet connection and the first stage pump.
- (13) Between the recirculation valve and the fuel inlet connection.
- (14) Between the two connections on the recirculation valve.

B. Remove the following connectors and T-pieces:

- (1) The multiple connector from the emergency dump valve drain location.
- (2) The union adapter to the oil cooler drain location.
- (3) The multiple connector to the throttle valve actuator drain location.
- (4) The adapter to the drain location in the reheat fuel feed pipe filter housing.
- (5) The connector from the drain location at the main feed tube joint.
- (6) The connector on the fuel heater and filter.
- (7) The connector on the first stage pump drain location.
- (8) The connector on the first stage pump fuel inlet elbow.
- (9) The T-piece on the bracket mounted on the reheat control unit elbow.
- (10) The T-piece on the bracket mounted on the second stage pump exhaust duct flange.

21. Remove the Fuel Drains Tube, Dump Valve to Drains Tank (Ref. Fig.113 Item 73)

- A. Using spanner (Tool 1565) loosen the ringnut securing the tube to the drains tank.
- B. Remove the nut, bolt and loop clamp securing the tube.
- C. Remove the bolts and bracket from the tube flange, dump valve connection on the distribution and dump valve.
- D. Unscrew the ringnut and remove the tube.
- E. Remove seal ring from tube.

OVERHAUL****22. Remove the Anti-icing System****A. Pressure Switch and Tube (Ref.Fig.114 Item 72).**

- (1) Disconnect air tube from switch.
- (2) Remove the nuts and bolts securing the switch.
- (3) Remove the pressure switch.
- (4) Unscrew the tube union nut from the anti-icing supply tube connection (Tool 1480).
- (5) Remove the nuts, bolts, loop clamps and half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube and detach tube from engine.

**B. Air Valve and Associated Tubes (Ref.Fig.114 Item 71).**

- (1) Remove the ferrule assembly from the rear tube connection forward of the air valve.
- (2) Remove the nuts and bolts securing the air valve to the elbow and rear tube flanges, remove the air valve.
- (3) Unscrew the bolts securing the elbow and remove.
- (4) Remove electrical harness tray support brackets.
- (5) Remove the screws retaining the strainer and remove the strainer from the CCOC casing.
- (6) Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), retaining the rear tube.
- (7) Remove the nuts, bolts, retaining plate and bracket from the front tube rear flange.
- (8) Slide the rear tube to the rear and disconnect from the front tube.
- (9) Remove the nut, bolt and retaining plate securing the forward tube in the duct.
- (10) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), retaining the front tube and remove the tube.

**OLYMPUS 593**

OVERHAUL

**23. Remove the Electrical Tray (Ref.Fig.113 Item 70)**

- A. Remove the nuts, bolts and loop clamps from the electrical tray mounted between the LP turbine and the reheat purge air and fuel feed tubes at the bottom of the engine.
- B. Unscrew the nut securing the tray to the pillar bolt and remove the tray.

**24. Remove the Reheat Fuel Feed Tube (Ref.Fig.113 Item 69)**

- A. Slacken the serrated union nuts securing the fuel feed tube to the reheat control unit and spray ring tube (Tool 1529).
- B. Remove the nuts, bolts and loop clamps securing the tube along the bottom of the engine.
- C. Unscrew the tube nuts and remove the tube.

**25. Remove Air Ducts and Vent Tubes (Ref.Fig.112 and 113 Item 68)**

- A. Ducts and Tubes, CCOC to Exhaust Diffuser Right-hand Bottom of Engine.
  - (1) Remove the nuts, bolts and retaining plates retaining the tube, duct and elbow joints.
  - (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to a bracket mounted on the CCOC/exhaust diffuser case flange.
  - (3) Remove the nuts securing the elbow and brackets to the exhaust diffuser casing.
  - (4) Withdraw the elbow from the tube and the tube from the duct.
  - (5) Temporarily replace elbow on exhaust diffuser.
  - (6) Remove the nuts and bolts securing the duct to the support tube, withdraw the duct from the elbow.
- B. Ducts and Tubes, CCOC to Exhaust Diffuser Left-hand Bottom of Engine.
  - (1) Remove the nuts, bolts and retaining plates retaining the tube, duct and elbow joints.

- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to the bracket mounted on the CCOC/exhaust diffuser case flange.
- (3) Remove the nuts securing the elbow and brackets to the exhaust diffuser case.
- (4) Withdraw the elbow from the tube and the tube from the duct.
- (5) Temporarily replace elbow on exhaust diffuser.
- (6) Remove the nuts, bolts and support link supporting the duct and the bracket mounted on the support tube.

**26. Remove the Cooling Air Tubes, LP and HP Turbine Bearings****A. Rear Tube, Turbine Shroud Elbow to Right-hand HP Casing (Ref.Fig.114 Item 67).**

- (1) Remove the bolt and retaining plate retaining the tube in the elbow.
- (2) Using spanner (Tool 1529) loosen the serrated union nut securing the forward end of the rear tube to the forward tube.
- (3) Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to brackets mounted at either end of the CCOC.
- (4) Remove the tube from the elbow.

**B. Forward Tubes, Intermediate Casing to Exhaust Diffuser, Right-hand Side (Ref.Fig.114 Item 66).**

- (1) Loosen the bolts securing the forward flanged end of the upper tube and the support bracket.
- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to a bracket mounted on the HP case rear flange.
- (3) Remove the bolts from the tube flange and the tube.
- (4) Remove the nut, bolt and retaining plate securing the lower tube and elbow mounted on the CCOC.

DISASSEMBLY

OVERHAUL

- (5) Loosen the bolts securing the forward flanged end of the tube.
- (6) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to a bracket mounted on the HP case.
- (7) Remove the bolts and bracket from the tube flange and the tube.
- (8) Remove the nuts and bolts securing the make-up piece to the elbow on the intermediate case.
- (9) Remove the make-up piece.

**27. Remove Oil Tubes, Pump to LP and HP Compressor Thrust Bearings , Oil Failure Warning (Ref.Fig.113 Item 65)**

- A. Loosen the tube union nuts at the intermediate case union and at the two tube section.
- B. Remove the bolts securing the lower tube to the pulse probe drive housing.
- C. Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the tube to brackets mounted on the intermediate/HP case flange.
- D. Unscrew the tube union nut and remove the tube.
- E. Remove the bolt, clipnut, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the remaining tube to a bracket mounted on the intermediate/HP case flange and remove the tube.

**28. Remove the Oil Scavenge and Feed Tubes, LP and HP Thrust Bearings, Bearings to Pump**

- A. Scavenge Tube (Ref.Fig.113 Item 64).
  - (1) Loosen the bolts securing the tube flanges to the main oil pump housing and pulse probe drive housing.
  - (2) Unscrew the bolts, remove the bracket and withdraw the tube from the mounting faces.
  - (3) Remove the nuts, bolts and bracket secured to the lug on the tube.

B. Feed Tube (Ref.Fig.113 and 114 Item 63).

- (1) Loosen the tubes union connections (Tools 1565, 1528).
  - (a) Between the lower tube and the oil pump housing.
  - (b) Between the upper tube and the connection at the vane two position on the intermediate case.
  - (c) Between the two tubes.
  - (d) Between the upper tube and the tube connected to the right-hand gearbox.
  - (e) The tube flange bolts to the right-hand gearbox.
  - (f) Remove the nuts, bolts and loop clamps.
- (2) Remove the tube flange bolts, unscrew the tube union nut and remove the tube.
- (3) Unscrew the union nuts retaining the upper tube and remove the tube.
- (4) Unscrew the union nut securing the lower tube to the oil pump housing and remove the tube.

29. Remove the Hydraulic Pump Drain Tubes, Seal Space to Oil Tank Overboard Vent (Ref.Fig.113 Item 62)

A. Loosen the tubes unions and connection:

- (1) Bolts securing forward tube flange to hydraulic pump adapter.
- (2) Union nut securing the forward tube to the standby pump adapter.
- (3) The centre tube union nut to the front tube.
- (4) The rear tube union nut to the centre tube.
- (5) The rear tube union nut to the oil tank overboard vent.

- B. Remove the nuts, bolts, spacer (SB.0L.593-71-8988-32 standard), loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the rear tube.

OVERHAUL

**31. Remove Oil Scavenge Tubes, Oil Pump Housing to HP Compressor Diffuser Case, LP and HP Turbine Bearings**

**A. LP Turbine Bearing to Pump Tubes (Ref.Fig.113 Item 60).**

- (1) Loosen the unions and connection (Tools 1526, 1528):
  - (a) The forward tubes flange bolts securing the tube to the oil pump mounting face.
  - (b) The union nut connecting the tubes.
  - (c) The union nut securing the rear tube at the exhaust diffuser case.
- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the rear tube.
- (3) Unscrew the union nuts securing the rear tube and remove the rear tube.
- (4) Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard), securing the forward tube.
- (5) Unscrew the bolts securing the tube flange and bracket, remove the bracket and tube.

**B. HP Turbine Bearing to Pump Tubes (Ref.Fig.113 Item 59).**

- (1) Remove the bolts securing the thermometer in the tube, withdraw the thermometer.
- (2) Loosen the unions and connection (Tools 1526, 1528):
  - (a) The forward tubes flange bolts securing the tube to the oil pump mounting face.

- (b) The tubes connecting union nut.
- (c) The rear tube union at the delivery case.
- (3) Remove the bolts securing the front tube flange, unscrew the union nut and remove the tube.
- (4) Remove the bolt, clipnut and loop clamp securing the rear tube.
- (5) Unscrew the tube union nut from the delivery case union and remove the rear tube.

### 32. Remove Fuel Tubes

#### A. Fuel Outlet, Distribution and Dump Valve to FCU Tube Union (Ref.Fig.112 Item 58).

- (1) Loosen the tube union nut at the FCU tube union.
- (2) Loosen the bolts retaining the tube flange to the distribution and dump valve.
- (3) Remove the bolt, clipnut and loop clamp securing the tube.
- (4) Unscrew the flange bolts and union nut and remove the tube.

#### B. Fuel Feed, Adapter Block and Engine Flowmeter to Distribution and Dump Valve (Ref.Fig.112 Item 57).

- (1) Remove the ferrule assembly from the tube rear connection.
- (2) Remove the nut, bolt and loop clamp securing the tube.
- (3) Remove the nuts and bolts securing the tube rear flange to the oil tank overboard vent pipe support bracket.
- (4) Remove the bolts, nuts and nutplate retaining the tube rear flange and the seal plate between the mating faces.
- (5) Remove the nuts and bolts retaining the tube front flange and remove the tube and seal plate.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (6) Remove the nuts and bolts securing the flowmeter to the distribution and dump valve, remove the flowmeter and seal plate.

NOTE: A make-up piece (transit) may be fitted in lieu of the flowmeter, remove at this stage as for flowmeter.

- (7) Remove the bolts securing the adapter to the FCU mating face, remove the adapter and seal plate.

33. Remove Fuel Return Tube - Drains Tank to the First Stage Pump/Recirculation Valve (Ref.Figs.113 and 112 Item 56)

- A. Remove the pipe closure nut from the tube forward of the first stage pump.
- B. Loosen the tubes unions between the recirculation valve and the first stage pump.
- C. Remove the bolt, clipnut and loop clamp retaining the rear tube.
- D. Unscrew the union nuts securing the rear tube and remove the tube.
- E. Remove the bolt, clipnut and loop clamp retaining the forward tube.
- F. Unscrew the forward tube front union nut and remove the tube.
- G. Loosen the tube unions between the first stage pump and the drains tank.
- H. Unscrew the union nuts securing the front tube and remove the tube.
- J. Remove the nuts, bolts and loop clamps, unscrew the union nuts securing the next three tubes toward the rear and remove the tubes.
- K. Remove the nuts, bolt, pillar bolt, spacer and loop clamps retaining the rear tube.
- L. Unscrew the union nut securing the tube and remove the tube.

34. Remove the First Stage Pump and FCU Gland Drain Tube to the Second Stage Pump Drain (Ref.Fig.112 Item 55)
- A. Loosen the tube union nuts and the fluid passage bolt.
  - B. Remove the nut, bolt and loop clamp retaining the tube to a bracket.
  - C. Unscrew the tube union nut and the fluid passage bolt, remove the fluid passage bolt, washers and tube.
35. Remove the Second Stage Pump Air/Fuel Drain Tube (Ref.Fig.113 Item 54)
- A. Loosen the tube union nuts at the second stage pump elbow and the drains tank (Tool 1529).
  - B. Remove the nut, bolt and loop clamp retaining the tube.
  - C. Unscrew the tube union nuts and remove the tube.
  - D. Remove the bolts and bracket from the reheat fuel control unit flange.
  - E. Unscrew the bolts securing the bracket and elbow to the pump mounting face, remove the bolts, bracket elbow and seal plate.
36. Remove the Fuel Tube, FCU and Reheat Fuel Controller Return to First Stage Pump Inlet Elbow (Ref.Fig.112 Item 53)
- A. Loosen the tube flange bolts at the first stage pump and the two tube union nuts (Tool 1528) securing the first two tubes to each other and to the multi-connection tube secured to the FCU.
  - B. Remove the nut, bolts, clip nut and loop clamps retaining the second tube.
  - C. Unscrew the union nuts and remove the second tube.
  - D. Unscrew the bolts from the flange of the front tube and remove the tube and seal plate.
37. Remove the Fuel Tube, FCU and Reheat Fuel Controller to Three-way Connector (Ref.Fig.113 Item 52)
- A. Loosen the tube union nuts at the FCU and the three-way connector on the reheat control unit.

OLYMPUS 593

OVERHAUL

- B. Remove the nut, washer, spacer, bolt and loop clamp retaining the tube.
  - C. Unscrew the tube unions and remove the tube.
38. Remove the Fuel Tube, Second Stage Pump to Recirculation Valve (Ref.Fig.113 Item 51)
- A. Loosen the bolts securing the tube flange and the union nut.
  - B. Remove the nuts, bolts and loop clamps retaining the tube.
  - C. Unscrew the tube union nut and flange retaining bolts and remove the tube.
39. Remove the Fuel Tubes, FCU to Distribution and Dump Valve Rear Face (Ref.Fig.112 Item 50)
- A. Loosen the bolts securing the tubes flanges and union nut.
  - B. Remove the nut, bolt and loop clamp retaining the forward tube to the oil tank vent pipe support bracket.
  - C. Unscrew the tube flange bolts and union nut and remove the forward tube.
  - D. Remove the nut, bolt and loop clamp retaining the rear tube to the loop clamp on the FCU to dump valve tube and the bracket on the HP case front/rear joint flange.
  - E. Unscrew the tube flange bolts and remove the tube.
40. Remove the Fuel Tube, FCU to Manifold Dump Valve (Ref.Fig.112 Item 49)
- A. Remove the tube closure ferrule from the union on the tube rear flange.
  - B. Loosen and remove the bolts securing the tube flanges and remove the tube.
41. Remove the Reheat Purge Solenoid Valve and Air Tubes (Ref. Fig.113 and 114 Items 47 and 48)
- A. Remove the Tubes, Purge Valve to Exhaust Diffuser.
    - (1) Loosen the tubes union nuts between the purge valve and the exhaust diffuser connector and between the tubes.

OVERHAUL

43. Remove the Cylinder/Piston Unit, LP Shaft Signal System (Ref. Fig.112 Item 45)

**WARNING:** WASH HANDS AFTER CONTACT WITH LUBRICANT G ON SIGNAL SYSTEM COMPONENTS. LUBRICANT G IS TOXIC AND CONTAINS COPPER AND LEAD.

- A. Remove the nuts, screws, saddles, straps and conduits from the cable assembly.
- B. Disconnect centre cable from rear cable.
- C. Disconnect front cable from valve plunger mechanism.
  - (1) Remove nuts and bolts securing shield front adapter to shroud, turn shroud until withdrawal slots are aligned and withdraw reset plunger.
  - (2) Move retaining ring rearward and leave in position on shield adapter.
  - (3) Slacken clamp bolt and slide shield rearward.
  - (4) Disengage cable and turn shield to clear attachment flange.
- D. On engines to pre-SB.76-8582-28 standard detach piston and cylinder assembly.
  - (1) Remove straps and conduit from cable between front roller block and cylinder assembly.
  - (2) Release cable from front and rear roller blocks. Remove pins and washers with the outer roller of pre-SB.76-17 assemblies.
- E. On engines to SB.76-8582-28 standard.
  - (1) Remove nuts and bolts securing rear block to bracket.
  - (2) Compress slotted conduit and press rear block towards centre block.
  - (3) Remove guard plate at centre block.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (4) Turn slots of conduits to align with slots of rear and centre block.
  - (5) Refit the nuts, bolts and plunger (Tool 1298) to the dump valve.
  - (6) Remove nuts and bolts securing air vent tube support bracket and rear end of cylinder assembly to mounting bracket.
  - (7) Remove nuts securing baseplate to HP compressor rear flange.
  - (8) Compress end of slotted conduit and disengage assembly.
  - (9) Guide centre cable through conduit slots and remove assembly complete.
  - (10) Refit the nuts and bolts to the dump valve.
44. Remove the Fuel Tubes, Oil Cooler to Air Bleed Valve (Ref. Fig.112 Item 44)
- A. Remove the capnut, key-ring, chain and anchor ring assembly from the tube and bracket on the primary sprayer tube flange.
  - B. Unscrew the valve from the tube housing.
  - C. Loosen the tubes union nuts and the nuts and bolts securing the upper tube lug to the bracket on the primary sprayer tube flange.
  - D. Remove the nut, bolt and loop clamp retaining the upper tube.
  - E. Remove the nuts and bolts securing the tube lug and the bracket mounted to the tube lug.
  - F. Unscrew the tubes union nuts and remove the tubes.
45. Remove the Fuel Tubes, Distribution and Dump Valve to Pilot Nozzles (Ref.Fig.113 Item 43)
- A. Loosen the tubes union nuts and the tube flange securing bolts at the distribution block dump valve mounting.

DISASSEMBLY

71-00-01

Page 133

Dec 1/81

OLYMPUS 593

MK. 610-14-28

OVERHAUL

- B. Remove the Tube, Left-hand Nozzle to T-Joint.
- (1) Remove the nut, bolt and loop clamp securing the tube.
  - (2) Unscrew the tube union nuts and remove the tube.
- C. Remove the Tube, Right-hand Nozzle to T-Joint.
- (1) Remove the nuts, bolts and loop clamp securing the tube.
  - (2) Unscrew the tube union nuts and remove the tube.
- D. Remove the Tube, Distribution and Dump Valve to Delivery Case, Five Vane.
- (1) Remove the nuts, bolts and loop clamps securing the tube.
  - (2) Remove the nuts and bolts retaining the T-joint end of the pipe from the bracket mounted at number five vane on the delivery case.
  - (3) Unscrew the bolts securing the bracket and the tube flange, remove the bracket and tube.
46. Remove the Fuel Tubes, Starter Pump to Distribution and Dump Valve (Ref.Fig.113 Item 42)
- A. Remove the bolts securing the tube flange to the distribution and dump valve, remove the gasket.
  - B. Loosen and unscrew the tube union nuts.
  - C. Remove the nuts, bolts and loop clamps and remove the tubes.
47. Remove the Reheat Flowmeter (Ref.Fig.113 Item 41)
- A. Remove the nuts, washers and bolts securing the flowmeter to the control unit flange (Tool 1862).
  - B. Remove the nuts, washers and bolts securing the flowmeter to the supply pipe flange.

OLYMPUS 593

MK.610-14-28

OVERHAUL

C. Remove the flowmeter and seal plates.

**NOTE:** A make-up piece (transit) may be fitted in lieu of the flowmeter, remove at this stage as for flowmeter.

48. Remove the Fuel Tubes

A. Starter Pump to FCU (Ref.Fig.113 Item 37).

- (1) Loosen the tube union nuts and the bolts securing the filter housing assembly.
- (2) Remove the nuts, bolts and loop clamps retaining the lower tube.
- (3) Unscrew the tube union nuts and remove the tubes.
- (4) Unscrew the bolts securing the filter housing assembly. Remove the assembly and seal plate, withdraw the filter and seal plate (Pre SB.73-8311-62 standard).

B. Second Stage Pump to Starter Pump (Ref.Fig.113 Item 39).

- (1) Loosen the tube union nuts at the starter pump and feed tube (Tool 1565).
- (2) Remove the nut, bolt and loop clamp retaining the tube.
- (3) Unscrew the tube union nuts and remove the tube.

49. Remove the Starter Pump (Ref.Fig.113 Item 34)
- A. Remove the nut, washer and bolt retaining the pump to the front bracket.
  - B. Remove the bolts and flanged pins retaining the pump to the rear bracket and withdraw the pump.
50. Disconnect the Fuel Manifold Tubes to Distribution and Dump Valve (Ref.Fig.112 Item 40)
- A. Remove the ferrule assemblies from the tubes (Tool 1529).
  - B. Remove the bolts securing the tubes flanges to the distribution and dump valve.
  - C. Withdraw the seal plates from between the tubes flanges and distribution and dump valve faces.
  - D. Loosen the tubes union nuts (Tool 1529).
51. Remove the Oil Tank Overboard Rear Vent Tube and Support Bracket (Ref.Fig.113 Item 38)
- A. Remove the nut and bolt securing the tube and seal plate to the bracket.
  - B. Remove the flange nuts and bolts securing the rear tube and remove the tube assembly and the bracket.
  - C. Remove the nuts and bolts securing the seal plate to the tube.
  - D. Remove the nuts and washers retaining the bracket to the pillar bolts and distribution and dump valve front mounting bracket.
  - E. Remove the nuts, washers and pillar bolts from the reheat control unit support cone.
52. Remove the Reheat Controller/Distribution and Dump Valve (Ref. Fig.112 Item 36)
- A. SB.OL.593-71-8988-32. Remove the nut, spacer, bolt and loop clamp securing the flylead of the reheat controller to the bracket on the reheat flowmeter.
  - B. Remove the bolt, washer, distance piece and nut securing the support cone to the bracket on the HP case.

OVERHAUL

- C. Remove the bolts and pins securing the reheat controller/distribution and dump valve to the support bracket on the HP case/delivery case flange, withdraw the unit.
53. Remove the Reheat Controller and FCU to First Stage Pump Inlet Elbow Fuel Return Tube (Ref.Fig.113 Item 35)
- A. Loosen the tube union nuts (Tool 1752).
  - B. Remove the bolt, clip nut and loop clamp retaining the tube.
  - C. Unscrew the union nuts and remove the tube.
  - D. Remove the ferrule assembly from the connector block.
  - E. Remove the nuts, bolt and pillar bolt securing the connector block from the mounting on the reheat fuel controller.
54. Remove the LP and HP Turbine Bearing Cold Vent Tubes and Connector Assembly (Ref.Fig.113 Item 33)
- A. Remove the blanking ferrule assemblies from the tubes, bottom of engine, HP compressor diffuser case to exhaust diffuser case.
  - B. Loosen the tubes union nuts (Tool 1565).
  - C. Loosen the rear tubes flange bolts.
  - D. Remove the nuts, bolts and loop clamps retaining the tubes.
  - E. Unscrew the forward tube union nuts and remove the tube.
  - F. Unscrew the centre tube union nuts and remove the tube.
  - G. Unscrew the bolts retaining the rear tube flange and remove the tube.
  - H. Remove the bolts securing the connector to the bracket on the right-hand support tube and withdraw the connector.
55. Remove the HP and LP Turbine Oil Feed Tubes (Ref.Fig.113 Items 32 and 31)
- A. Loosen the tubes union nuts, bottom of the engine, left-hand gearbox to exhaust diffuser case (Tools 1565 and 1528).
  - B. Loosen the bolts securing the elbow to the left-hand gearbox.

DISASSEMBLY

## 71-00-01

Page 136

- C. Loosen the tube connection to the exhaust diffuser case (Tool 1526).
- D. Remove the nuts, washers, bolts, pillar bolt and loop clamps retaining the tubes.
- E. Unscrew the union nuts and tube connection securing the rear tubes, remove the tubes.
- F. Unscrew the front tube union nuts and remove the tube.
- G. Remove the bolts securing the elbow, withdraw the bracket and elbow.
- H. Remove the bolts securing the thermometer in the housing of the front tube, withdraw the thermometer.
56. Remove the Fuel Tube, Oil Cooler to Second Stage Pump (Ref. Fig.112 Item 30)
- A. Remove the nut, bolt and loop clamp retaining the tube.
- B. Loosen the bolts retaining the tube flanges.
- C. Remove the bolts securing the tube flange to the pump and the seal plate from between the mating faces.
- D. Remove the bolts securing the tube flange to the oil cooler, brackets, wire-locking washer and the seal plate from between the mating faces, remove the tube.
57. Remove the Fuel Tubes, Fuel Filter to Oil Cooler (Ref.Fig.112 Item 29)
- A. Remove the tube closure ferrules from the rear tube.
- B. Loosen the bolts retaining the tubes flanges.
- C. Remove the nut, bolt, washer, spacer and loop clamp retaining the tubes.
- D. Remove the nuts and bolts securing the tubes flanges together, bracket secured to the flange and the seal plate from between the flanges.
- E. Remove the bolts securing the forward tube flange to the fuel filter, withdraw the tube and seal plate.

- F. Remove the bolts securing the rear tube flange to the oil cooler, bracket, washers and wire-locking washer retained to the tube flange, withdraw the tube and seal plate.
58. Remove the Reheat Fuel Tube, First Stage Pump to Reheat Fuel Flowmeter (Ref.Fig.113 Item 28)
- A. Remove the tube closure ferrule from the filter blank plate.
  - B. Loosen the bolts securing the tube flanges.
  - C. Remove the nuts, bolts and loop clamps retaining the tubes.
  - D. Remove the bolts securing the tube to the first stage pump, withdraw the tube and seal plate.
  - E. Disassemble the Filter Assembly.
    - (1) Remove the nuts and bolts securing the blanking plate to the filter housing and the bracket secured to the housing flange.
    - (2) Remove the blank plate and seal plate.
    - (3) Withdraw the filter.
59. Remove the Electrical Harness Support Tray and Fuel and Hydraulic Pressurization Tube (Ref.Fig.113 Item 27)
- A. Electrical Support Tray.
    - (1) Remove the nuts, pillar bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard) retaining the tube to the tray.
    - (2) Remove the bolts securing the tray to the support bracket, remove the tray.
    - (3) Remove the bolts securing the bracket to the support bracket on the stage five duct, remove the bracket.
  - B. Pressurization Tube.
    - (1) Loosen and unscrew the tube union nut from the union on the duct mounted to the lower rear of the HP case, remove the tube.

## 60. Remove Oil Tubes

### A. Right-hand Gearbox to Oil Tank (Ref.Fig.112 Item 26).

- (1) Loosen the tubes unions between the oil return tube on the upper left side of the engine to the right-hand gearbox.
- (2) Loosen the bolts securing the tube flange to the mounting face.
- (3) Remove the nuts, bolts, clipnut and loop clamps retaining the tubes.
- (4) Unscrew the union nuts of the tube on the left-hand side of the engine and remove the tube.
- (5) Unscrew the bolts securing the bottom tube flange to gearbox and remove the tube.

### B. Anti-syphon Tube, Main Oil Feed to Return Tube (Ref. Fig.112 Item 25).

- (1) Loosen the tube union nut and the bolts retaining the flange.
- (2) Remove the nut, bolt and loop clamp retaining the tube.
- (3) Unscrew the bolts from the tube flange and the union nut, remove the tube.
- (4) Unscrew the strainer from the tube flanged end and discard the keywasher.

### C. Oil Tank to Main Oil Pump (Ref.Fig.112 Item 24).

- (1) Loosen the bolts securing the tubes flanges to the oil tank mounting from each other and the oil pump mounting face.
- (2) Unscrew the bolts securing the rear tube flanges, remove the brackets from the flanges and remove the tube.
- (3) Unscrew the bolts securing the forward tube flange to the oil tank, remove the tube.
- (4) Remove the retaining rings from the bolts and the bolts from the tube flange.

DISASSEMBLY

**71-00-01**

Page 139

OVERHAUL

D. Inlet Thermometer.

- (1) Loosen the bolts securing the thermometer flange to mating flange.
- (2) Unscrew the bolts, then remove the bracket and thermometer from the tube.

61. Remove the Fuel Recirculation Valve (Ref.Fig.112 Item 23)

- A. Cut the lockwire and remove the bolts securing the valve brackets to the mounting brackets front and rear, remove the valve.
- B. Remove the bolts and brackets secured to the valve.
- C. Release the clamp ring and remove the plunger assembly from valve.

62. Remove Vent Tubes, Intermediate Case Sump to Tube Connection (Ref.Fig.113 Item 22)

- A. Loosen the tubes union nuts (Tool 1565).
- B. Remove the nuts, bolts, loop clamps and the half clamp shells (SB.OL.593-75-8972-27 standard) retaining the tubes.
- C. Unscrew the union nuts securing the rear tube and remove the tube.
- D. Unscrew the union nut securing the front tube and remove the tube.

63. Remove Vent Tubes, Intermediate Case Adapter to Aircraft Connection (Ref.Fig.112 Item 21)

- A. Loosen the tubes union nuts (Tool 1528).
- B. Remove the nuts, bolts, loop clamps and the half clamp shells (SB.OL.593-75-8972-27 standard) retaining the tubes.
- C. Unscrew the union nuts securing the front tube and remove the tube.
- D. Unscrew the union nut securing the rear tube and remove the tube.

Printed in England

- E. Remove the nuts and bolts securing the tube end fitting to the bracket and the bracket to the support tube, remove the end fitting and the bracket.
- F. Remove the nuts and bolts securing the bracket to the LP shaft signal system base plate, remove the bracket.

64. Remove the Air Tubes, Fuel Heater System (Ref.Fig.112 Item 20 and Fig.105)

A. Heater Overboard Duct.

- (1) Remove the bolt securing the tube in the heater outlet elbow.
- (2) Remove the nuts and bolts securing the support strut and support lugs to the flange on the tube and the bracket mounted on the LP case front blow-off flange. Withdraw the support strut, support lugs and the tube.

B. Elbow and Vertical Tube from Valve Rear Face.

- (1) Remove the nuts, bolts and retaining plate at the rear top tube joint.
- (2) Remove the bolts securing the elbow to the valve, and the nuts and bolts securing the elbow to the vertical rear tube, remove the bracket and the elbow.
- (3) Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard) securing the tube and withdraw the tube.

C. Engine, Below Left-hand Trunnion Mount to Valve.

- (1) Remove the nuts, bolts, hollow pin and keep plate from the tube and elbow on the engine delivery case.
- (2) Remove the nuts and bolts securing the lower tube to the bracket.
- (3) Remove the bolts securing the tube lower flange to the valve and remove the valve.
- (4) Remove the nut, bolt and loop clamp retaining the lower tube.
- (5) Remove the tubes from the engine and separate them from each other.

D. Heater, Elbow Assembly and Forward Vertical Tube.

- (1) Remove the nuts, bolts and retaining plates from:
  - (a) The vertical tube top and bottom joints.
  - (b) The forward facing elbow joint.
- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard) from the top of the vertical tube and lift the tube away.
- (3) Remove the elbow and ring carrier seal from the heater joint and separate them from each other.

E. Horizontal Tube Assembly, HP Case to CCOC.

- (1) Remove the nuts, bolts and retaining plate from the front tube to the housing.
- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard) retaining the front tube and withdraw the tube from the housing.
- (3) Remove the nuts and bolts securing the housing to the bracket mounted on the LP compressor/intermediate case flange.
- (4) Remove the nuts, bolts and retaining plate from the housing rear joint and withdraw the housing from the tube.
- (5) Remove the nut, bolt, loop clamp and the half clamp shells (SB.0L.593-75-8972-27 standard) retaining the tube and remove the tube.

65. Remove the Air Supply Ducts from the Second Stage Pump (Ref. Fig.112 Item 19)

A. Loosen the nuts and bolts securing:

- (1) Intermediate case elbow and elbow duct flanges.
- (2) Elbow duct to duct flanges.
- (3) Duct to pump flanges.

B. Remove the bolt securing the elbow duct to the bracket.

DISASSEMBLY

71-00-01

Page 144

- D. Remove the bolts securing the tube rear flange to the oil cooler.
- E. Remove the nuts, bolts and loop clamps retaining the tube, withdraw the tube.
- F. Remove the bolts securing the container rear flange to the pump mounting face, withdraw the container.

**67. Remove the Vent Tubes**

**A. Left-hand Gearbox (Ref.Fig.112 Item 17).**

- (1) Loosen the tube union nuts (Tool 1529).
- (2) Remove the nut, bolt, loop clamp and the half clamp shells (SB.OL.593-75-8972-27 standard) retaining the tube.
- (3) Unscrew the tube union nuts and remove the tube.

**B. Oil Tank Front and Centre Vent Tubes (Ref.Fig.112 Item 16).**

- (1) Loosen the tubes union.
- (2) Remove the bolts and retaining plate from the oil tank vent valve housing assembly.
- (3) Remove the nuts, bolts and loop clamps retaining the centre tube.
- (4) Unscrew the tube union nut and remove the centre tube.
- (5) Remove the nuts, bolts and loop clamps retaining the front tube and withdraw the tube from the oil tank housing.

**C. Sump Vent Tubes, Sump to Oil Return Tube (Ref.Fig.112 Item 15).**

- (1) Loosen the tubes union nuts and the bolts securing the lower tube flange to the sump (Tool 908).
- (2) Remove the nut, bolts, loop clamps and clipnut retaining the lower tube.
- (3) Unscrew the bolts securing the lower tube flange and the tube union nut, remove the tube.
- (4) Unscrew the top tube union and remove the tube.

68. Remove the Oil Scavenge Tube, Oil Cooler to Oil Tank (Ref. Fig.112 Item 14)
- A. Remove the bolts securing the tube flanges to the oil cooler and the oil tank.
  - B. Remove the nuts, bolts, loop clamps and the half clamp shells (SB.0L.593-75-8972-27 standard) retaining the tube, remove the tube.
69. Remove the Oil Feed and Return Tubes, Oil Cooler to IDG (Ref. Fig.113 Item 13)
- A. Loosen the tubes union nuts and the bolts securing the tubes flanges (Tool 1528).
  - B. Remove the nut, bolts, clipnuts and 'paired' loop clamps retaining the feed and return tubes, IDG to tubes unions. Unscrew the union nuts securing the tubes and remove the tubes.
  - C. Remove the nuts, pillar bolts and loop clamps retaining the bottom left-hand forward tube, unscrew the flange retaining bolts and withdraw the bracket and tube.
  - D. Remove the nuts, bolts and loop clamps retaining the bottom left-hand rear tube, unscrew the flange retaining bolts and withdraw the tube.
70. Remove the Oil Cooler (Ref.Fig.112 Item 12 and Fig.106)
- A. Link.
    - (1) Remove the bolt retaining the link to the oil cooler upper bracket.
    - (2) Withdraw the flanged pin.
  - B. Lower Rear Bracket.
    - (1) Remove the nut, washer and bolt retaining the cooler to the bracket.
    - (2) Withdraw the flanged pin.
  - C. Lower Front Bracket.
    - (1) Remove the bolt and washer retaining the cooler to the lower front bracket.
    - (2) Withdraw the flanged pin and the shim.

(3) Remove the oil cooler.

D. Remove the Brackets.

- (1) Remove the nut and D-headed bolt retaining the link to the upper rear bracket, remove the link.
- (2) Remove the nuts and D-headed bolts retaining the rear bracket to the HP case, withdraw the bracket.
- (3) Remove the bolts securing the front bracket to the HP case, withdraw the bracket.

71. Removal of Fuel Manifolds and Feed Tubes (Ref.Fig.112 and 114 Item 11 and Fig.107)

A. Lower Fuel Tube.

- (1) Unscrew the tube union nut from the bottom manifold (Tool 1528).
- (2) Remove the nut, bolt and loop clamp retaining the tube, withdraw the tube.

B. Upper Fuel Tube.

- (1) Unscrew the tube union nut from the top manifold (Tool 1528).
- (2) Remove the nuts, bolts and loop clamps retaining the tube, withdraw the tube.

C. Fuel Manifold.

- (1) Loosen the union nuts securing the manifold tube halves.
- (2) Loosen and unscrew the union nuts securing the manifold tubes to the pairs of sprayer unions.
- (3) Remove the nuts, bolts and loop clamps retaining the bottom manifold tube to brackets secured to the HP case/delivery case flange.
- (4) Unscrew the union nuts securing the bottom manifold tube to the top tube and withdraw the bottom tube.
- (5) Remove the nuts, bolts and loop clamps retaining the upper manifold tube to brackets secured to the HP case/delivery case and withdraw the tube.

72. Remove the LP Compressor Bearing Vent Tubes (Ref.Fig.113 Item 10)

A. Loosen the Tubes Union Nuts:

- (1) At the flanged connector, LP case front blow-off flange, both tubes.
- (2) At the adapters on the left and right-hand bottom intake case adapters.

B. Remove the Tubes and Connector.

- (1) Remove the nut, bolt and loop clamp retaining the left-hand tube.
- (2) Unscrew the tube union nuts and withdraw the tube.
- (3) Remove the nuts, bolts and loop clamps retaining the right-hand tube.
- (4) Unscrew the tube union nuts and withdraw the tube.
- (5) Remove the nuts and bolts securing the connector to the LP front blow-off flange and withdraw the connector.

73. Remove the LP Compressor Bearings Oil Feed and Scavenge Tubes

A. Pillar Bolt (Ref.Fig.113 Item 9).

- (1) Remove the nut and pillar bolt mounted to the bracket on the LP case rear blow-off flange below and to the rear of the oil tank.
- (2) Remove the loop clamps from the tube which were secured by the nut and pillar bolt.

B. Filter from Oil Scavenge Tube (Ref.Fig.113 Item 9).

- (1) Remove the union nut and blanking ferrule retaining the filter in the scavenge oil tube below the oil tank (Tool 1526).
- (2) Withdraw the filter from the tube carefully to retain any metal flakes etc to the filter and place in a plastic bag.

TN46777

**OLYMPUS 593**  
MK.610-14-28  
OVERHAUL

C. Scavenge Oil Tubes (Ref.Fig.113 Item 9).

- (1) Loosen the tubes union nuts (Tool 1565) securing the front tube to the adapter on the intake case and the rear and front tubes.
- (2) Loosen the bolts securing the rear tube flange to the oil pump housing mounting face.
- (3) Remove the nuts, bolts and bracket secured to the bracket at the forward end of the tube.
- (4) Remove the nut, bolt, distance piece and loop clamp retaining the rear tube to the bracket mounted on the LP case.
- (5) Unscrew the rear tube union nut and bolts securing the flange, withdraw the tube.
- (6) Remove the bolts, bracket and blank secured to the front tube mounting face.
- (7) Remove the nut, bolt and loop clamp securing the front tube to the bracket mounted on the LP case.
- (8) Unscrew the front tube union nut and withdraw the tube.

D. Feed Tube (Ref.Fig.113 Item 8).

- (1) Loosen the tube union nut (Tool 1528) to the air intake flange assembly and the bolts securing the flange to the oil pump housing mounting face.
- (2) Remove the nuts, bolts, bracket and loop clamps retaining the tube to the brackets mounted to the bottom of the LP case.
- (3) Unscrew the bolts retaining the tube flange to the oil pump housing and the union nut at the intake elbow and remove the tube.
- (4) Remove the filter assembly from the flange assembly.

74. Remove the HP Cooling Air Ducts (Ref.Fig.114 Item 7)

A. Top Ducts.

- (1) Unlock the keywashers (Pre-SB.75-2) or cut the wire-locking (SB.75-2) from bolts securing the forward duct to the HP compressor case and remove the bolts.

DISASSEMBLY  
**71-00-01**

Page 151

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (2) Withdraw the duct from the pipe.
- (3) Withdraw the pipe from the rear duct.
- (4) Remove the bolts securing the rear duct to the diffuser case and withdraw the duct.

B. Lower Ducts.

- (1) Remove the bolts securing the mounting bracket to the forward duct mounted to the HP compressor case, withdraw the bracket.
- (2) Remove the bolts securing the duct and the bracket mounted on the duct flange, withdraw the bracket and duct from the central duct.
- (3) Withdraw the central duct from the rear duct.
- (4) Remove the nuts and bolts retaining the brackets to the rear duct lugs, withdraw the brackets and clip-nuts from the brackets.
- (5) Remove the bolts securing the rear duct flange and bracket to the diffuser case, withdraw the bracket and duct.

75. Remove the Drains Tank. (Ref.Fig.113 Item 6)

A. Drains Tank.

- (1) Remove the nuts and bolts securing the tank to:
  - (a) The left-hand bracket.
  - (b) The right-hand link.
- (2) Remove the nut and bolt Pre-SB.71-14 securing the rear of the tank to the mounting bracket. Remove the nut SB.71-14 securing the rear of the tank to the mounting bracket. Withdraw the tank.

B. Mounting Brackets.

- (1) Remove the nut, bolt and bracket secured to the bracket attached to the bottom inspection port on the CCOC.
- (2) Remove the nut, bolt and mounting link secured to the bracket on the left-hand CCOC support tube.

OVERHAUL

- (3) Remove the nuts, bolts and drains tank mounting bracket secured to the bracket mounted between the centre and left-hand CCOC support tubes. Remove the bolt head trap and bolt SB.71-14.
- (4) Remove the nuts, bolts and bracket secured to the CCOC support tubes.

**C. Disassemble the Drains Tank.**

- (1) Drains plug.
  - (a) Unscrew the drains plug and withdraw the plug and sealing washer from the tank.
- (2) Seal plate.
  - (a) Position the restraining fixture (Tool 940) to the seal plate to hold the special bolts.
  - (b) Remove the nuts securing the seal plate bolts.
  - (c) Remove the seal plate and sleeve from the overflow valve body.
  - (d) Remove the restraining fixture from the seal plate and withdraw the bolts.
- (3) Multiple connector.
  - (a) Unscrew the adapter.
  - (b) Withdraw the adapter and the connector.
- (4) Overflow valve.
  - (a) Remove the adapter union from the overflow vent body.
  - (b) Depress the valve and remove the retaining ring securing the sealing valve assembly in the overflow vent body.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (c) Carefully withdraw the sealing valve, spring and valve housing from the overflow vent body.
- (d) Remove the nuts and bolts securing the overflow vent body to the separator body and withdraw the overflow vent body and valve body.
- (e) Withdraw the filter from the separator body.

76. Remove the Support Tubes from the CCOC (Ref.Fig.113 Item 5)

A. Centre Tube.

- (1) Remove the pillar bolt from its location on the rear of the tube.
- (2) Remove the nuts and bolts securing the tube and bracket to the rear face of the inspection port bracket.
- (3) Withdraw the tube from the retaining bracket mounted to the CCOC/exhaust diffuser flange.
- (4) Remove the nuts and bolts securing the brackets to the tube.

B. Right-hand and Left-hand Tubes.

- (1) Remove the nuts securing the tube brackets to the pillar bolts on the CCOC/HP compressor diffuser case flange.
- (2) Remove the tubes from the pillar bolts and withdraw from the retaining brackets mounted to the CCOC/exhaust diffuser flange.

77. Remove the First Stage Fuel Pump and Heater Assembly (Ref. Fig.112 Item 4)

- A. Remove the bolts securing the assembly bracket to the bracket mounted on the main oil pump.
- B. Release the QAD coupling and remove the assembly from the gearbox, place on clean workbench and support.

78. Remove the Actuator Gearbox (TV) (Ref.Fig.112 Item 3)

- A. Remove the bolts and washers securing the actuator to FCU and withdraw actuator.
- B. Remove the countersunk screws and seal plate from the actuator.

79. Remove the FCU/Second Stage Fuel Pump (Ref.Fig.112 Item 2 and Fig.109)

## A. Remove Combined Units.

- (1) Assemble the lifting equipment (Tools 1854 and 854) to the FCU.
  - (a) Hook the lifting tools (Tool 1854) to the two bolts securing a blank plate on the FCU forward face, locating the bolts in the holes of the tools recessed face.
  - (b) Withdraw the bolts and retain so they do not protrude below the tools mating faces.
  - (c) Pivot the tool on the FCU bolts, align the tools mating faces to the mounting faces at the rear of the FCU, locate the bolts and tighten.
  - (d) Install the counterbalanced lifting arm (Tool 854) to the lifting tool and carefully take the weight of the assembly with a crane.

**CAUTION:** HANDLE THE COUNTERBALANCED LIFTING EQUIPMENT WITH CARE ESPECIALLY WHEN REMOVING IT FROM AN INSTALLED ITEM.

## (2) Remove the QAD coupling.

- (a) Remove the bolt and nut securing the coupling to the bracket.
- (b) Release the QAD coupling (Ref.72-09-00 Disassembly).
- (3) Carefully raise the assembly, maintain the mating faces parallel until the locating dowels are disengaged, remove the assembly.
- (4) Refit the bolt, washer and nut to the QAD coupling.
- (5) Remove the lifting equipment from the FCU.

DISASSEMBLY

71-00-01

Page 157  
Dec 1/97

OLYMPUS 593

MK. 610-14-28

OVERHAUL

- (6) Remove the bracket.
  - (a) Remove the nuts and bolts securing the tube to the FCU.
  - (b) Remove the bolts securing the bracket to the FCU, withdraw the bracket.
- (7) Remove the FCU tube.
  - (a) Remove the bolts securing the tube.
  - (b) Withdraw the tube and seal plate.
- (8) Separate the FCU and second stage pump.
  - (a) Remove the bolt and washer from the tie bar attachment point. Withdraw the eccentric bush and cupwasher from the tie bar.
  - (b) Remove the nut and bolt from the connecting rod spherical bearing.
  - (c) Remove the bolts and washers securing FCU to the second stage pump.
  - (d) Withdraw the FCU from the second stage pump and remove the seal plate.
  - (e) Remove the butterfly lever assembly.

80. Remove the FCU/Second Stage Fuel Pump Lifting Bracket (Ref. Fig.112 Item 1)

- A. Remove the nuts, bolts, washers, spacer and loop clamps retaining the tube section of the lifting bracket to the bracket mounted on the left-hand gearbox.
- B. Remove the bolts securing the lifting bracket flange to the gearbox, withdraw the lifting bracket.
- C. Replace the bolts and spacer washers to the gearbox, torque-tighten the bolts between 60 and 65 lbf in. (6,8 and 7,3 N.m).

81. Remove the Left-hand Gearbox (Ref.Fig.110)

- A. Assemble the Lifting Equipment (Tool 197).
  - (1) Remove the pin securing the gearbox attachment from the lifting arm.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Assemble the gearbox attachment to the FCU/second stage pump mounting face, secure with the QAD coupling.
- (3) Position a hoist over the lifting arm, position the hook in the ring.

NOTE: The arm has a counterbalance weight to balance the weight of the gearbox during assembly/disassembly of the gearbox. Care is essential when lifting the arm with the hoist to attach to the gearbox attachment.

- (4) Lift the arm and position over the gearbox.
- (5) Support the arm and align to the gearbox attachment, refit the pin securing the gearbox attachment to the arm.
- (6) Adjust the hoist until the arm is in the horizontal position.

B. Remove the Gearbox (Tool 197).

- (1) Remove the nuts (Tool 1530) and load spreading washers from the bolts retaining the gearbox to the plate adapter mounted to the bracket secured to the intermediate case.

NOTE: The bolts are retained to the plate adapter by retaining rings.

- (2) Remove the bolts from the rear gearbox mounting bracket securing the bracket to the intermediate case.
- (3) Disconnect the air pressurization tube from the gearbox.
- (4) Remove the bolts from the front gearbox mounting bracket securing the bracket to the intermediate case.
- (5) Loosen the gearbox and carefully withdraw from the engine, support the drive shaft and remove when the gearbox is clear of the engine.
- (6) Place the gearbox on a pallet and remove the lifting equipment.

82. Remove the Right-hand Gearbox (Ref.Fig.111)

- A. Assemble the Lifting Equipment (Tools 793, 794, 795, 798 and 1302).

OVERHAUL

- (1) Assemble the right and left-hand trunnions to the lifting beam, secure to the studs with washers and nuts.

NOTE: The arm has a counterbalance weight to balance the weight of the gearbox during assembly/disassembly of the gearbox. Care is essential when lifting the arm and beam assembly with the hoist to attach to the gearbox.

- (2) Lift the arm and counterbalance weight on a hoist, position to the lifting beam.
- (3) Assemble the lifting beam to the lifting arm.
- (4) Position the hoist and lifting arm over the right-hand gearbox.
- (5) Secure the trunnions to the left and right-hand lifting positions with bolts and washers.
- (6) Adjust the hoist until the arm is in the horizontal position using the turnbuckle (Tool 1302) for fine adjustment.

WARNING: AT ALL TIMES ENSURE THE LOCK PIN IS ENGAGED IN THE TRUNNION. WHEN TURNING THE GEARBOX IN THE HOIST KEEP FINGERS CLEAR FROM BETWEEN THE GEARBOX AND HOIST AS THE GEARBOX IS NOT BALANCED ABOUT ITS PIVOT AND CAN SPIN IN THE HOIST.

**B. Remove the Gearbox.**

- (1) Release gearbox from intermediate case at flexible coupling shaft location.
  - (a) Remove the nuts from the flange securing bolts using the swivel wrench (Tool 3132).
- (2) Remove the bolts and dowels securing the front mounting bracket.
- (3) Disconnect the air pressurizing tube from the gearbox.
- (4) Remove the bolts and nuts securing the rear mounting bracket to the intermediate case/HP case flange.

DISASSEMBLY

OVERHAUL

- (5) Remove the bolts securing the rear mounting bracket to the gearbox.

**CAUTION:** DO NOT ALLOW THE GEARBOX TO SWING ON REMOVAL AS THE DRIVE SHAFT IS INTEGRAL WITH THE GEARBOX AND COULD BE DAMAGED.

- (6) Loosen the gearbox and mounting brackets, withdraw from the dowels. Balancing the lifting equipment and gearbox by the arm withdraw the gearbox from the engine.
- (7) Lower the gearbox on a pallet, remove the lifting equipment.

### 83. Removal of the Pressurizing Air Supply Tubes

- A. Loosen the tubes union nuts at the stage three HP compressor, right-hand gearbox and pulse probe housing on the left-hand side of the engine.
- B. Remove the nuts, bolts, washers, loop clamps, half clamp shells (SB.0L.593-75-8972-27 standard) and clipnuts retaining the tubes to brackets mounted on the LP compressor case rear flange.
- C. Unscrew the tube union nuts securing the right-hand tube, HP compressor to right-hand gearbox and remove the tube.
- D. Unscrew the tube union nuts securing the bottom tube, right-hand gearbox to intermediate case sump and remove the tube.

### 84. Remove the Oil Tank

- A. Disconnect the Brackets Securing the Tank to the Engine.
- (1) Support the tank.
- (2) Remove the nut and bolt securing the front lower bracket to the bracket mounted on the intake/LP case flange.
- (3) Remove the nut and bolt securing the rear lower bracket to the stiffener plate mounted to the LP case front blow-off flange.

DISASSEMBLY

71-00-01

Page 163

MK. 610-14-28  
OVERHAUL

- (4) Remove the bolts securing the rear upper bracket to the LP case front blow-off flange.
- (5) Withdraw the oil tank from the engine.

85. Remove the Heat Shield Covers

A. Heat Shield Covers.

- (1) Remove the nut and washer securing the heat shield covers at the top position.
- (2) Remove the bolts and washers securing the left and right-hand heat shield covers and withdraw the covers.

NOTE: With the removal of the tubes and accessories, the bare engine is now in a condition to be disassembled into a number of sub-assemblies/modules. Refer to 72-00-00 Disassembly for the disassembly of the engine.

TUBES AND ACCESSORIES - ASSEMBLY

1. General

- A. Prior to commencing the installation of the accessories and tubes, refer to 71-09-00 Assembly for general information.
- B. Where a part is named in the assembly procedure, the Illustrated Parts Catalogue (I.P.C.) item number is given to identify the part from those of similar appearance and description. For example, an item quoted as bolt (72-01-03/1-30) would be found in I.P.C. topic 72-01-03, Figure 1, as item 30.
- C. Throughout the text each special tool is identified by a separate tool reference number e.g. (Tool 1234). For a complete list of tooling required for all stages of assembly and for the Manufacturer's Part No. refer to Special Tools, Fixtures and Equipment, Table 1001.
- D. This chapter/topic is divided into 7 sequential stages. The location of tubes and accessories is shown in Figure 501 of this assembly stage and each item reference is given in the relevant stage of procedure.
- E. It may be necessary to turn the gearbox to engage the drive shafts of some accessories during installation. To turn the gearboxes, hand turning equipment must be used. Details of the installation and operation of the equipment is given in 72-09-01 Assembly.
- F. Installed clearances of tubes and components must be checked concurrent with their installation and conform to the limits stated in ASSEMBLY, STAGE 7, paragraph 6.

TUBES AND ACCESSORIES - ASSEMBLY

1. Assemble Lifting Bracket (72-62-01/7-200) for FCU/Second Stage Pump (Ref. Item 1, Fig.501 of Stage 1)

A. Prepare for Installation.

(1) Remove the three bolts at the positions indicated in detail A, from the flange on the rear face of the left-hand gearbox.

(2) Apply lubricant 'B' to the bolts.

B. Install the Lifting Bracket (72-62-01/7-200) (Ref.Fig.501).

(1) Position the bracket on the left-hand gearbox and secure with the previously removed bolts torque-tightened to between 90 and 100 lbf in. (10,2 and 11,3 N.m).

(2) Secure the tube section to the bracket (72-33-01/6-300) located near the left-hand gearbox rear mounting bracket.

(a) Secure the tube to the bracket at position X with a loop-clamp, bolt, flat washer and nut (72-62-01/7-10-40-30-20). Torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(b) Attach the tube to the bracket at position Y with a loop-clamp (72-62-01/7-10); bolt, nut and washers and distance piece (72-01-03/5-50-20-30-40) lightly tightened. Additional tubes are assembled to this position at a later stage.

2. Install the FCU/Second Stage Pump (Ref. Item 2, Fig.501 of Stage 1).

A. Prepare for Installation.

(1) Record the type and serial numbers of the FCU and second stage pump on the accessory sheet.

B. Installation (Ref.Fig.502).

- (1) Assemble the tube (73-13-08/1-230) to the FCU.
  - (a) Apply lubricant 'B' to the tube attachment bolts.
  - (b) Position the tube on the FCU, insert seal plates (73-13-08/1-290) between the tube flanges and the FCU mounting faces, secure the flanges with bolts (73-13-08/1-240).
  - (c) Torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Ensure that there is a minimum clearance of 0.100 in. (2,54 mm) between the installed tube and adjacent parts on the FCU.
- (2) Assemble the bracket (73-13-08/1-280) to the FCU.
  - (a) Apply lubricant 'B' to the bolts (73-13-08/1-270).
  - (b) Position the bracket on the FCU and tube flange and insert the attachment bolts.
  - (c) Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Secure the tube to the bracket.
  - (a) Apply lubricant 'B' to the bolts and nuts (73-13-08/1-250-260).
  - (b) Secure the tube to the bracket with bolts and nuts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (c) Check that there is a minimum clearance of 0.100 in. (2,54 mm) between the funnel section of the mini-hoist tube and the fuel tube on the second stage pump and a minimum clearance of 0.070 in. (1,75 mm) between the mini-hoist tube and the fluid passage bolt on the second stage pump.

SNECMA

C. Install the FCU/Second Stage Pump (Ref.Fig.503).

- (1) For details of the quick attach/detach QAD coupling preparation and assembly, with lubrication of the toroidal sealing ring, refer to 71-09-00/Assembly.
- (2) Install the lifting equipment (Tools 1854 and 854).
  - (a) Assemble the lifting equipment to the FCU attachment points as shown in Figure 503.
  - (b) Install the counterbalanced lifting arm to the lifting tool and carefully hoist the assembly with a crane.
  - (c) Locate a toroidal sealing ring (72-62-01/6-90) in the groove of coupling ring retaining flange.

**CAUTION:** HANDLE THE COUNTERBALANCED LIFTING EQUIPMENT WITH CARE ESPECIALLY WHEN REMOVING IT FROM AN INSTALLED ITEM.

- (d) Align the FCU drive shaft and mounting face to the right-hand gearbox location.
- (e) Engage the drive splines and lower the unit keeping the mating faces parallel. Turn the engine to align the mating splines if necessary using the hand-turning equipment.
- (f) Ensure that sealing ring is not displaced, press assembly squarely in position until joint faces abut.
- (g) Turn coupling ring in direction to bring trunnions together, and engage threads of ring with those of threaded flange as far as possible by hand.

**CAUTION:** ENSURE THAT THREADS HAVE ENGAGED FREELY BEFORE APPLYING TIGHTENING FORCE TO RING.

- (h) Position spherical washer on clamping bolt, then insert bolt through fixed locking trunnion to engage threads of spherical nut of coupling ring trunnion by hand.
- (3) Tighten the coupling ring in accordance with the procedure given in 72-09-00, QAD Coupling - Installation. Use the following locking (run-down) torque and torque-tightening values for the clamping bolt.
  - (a) Locking (run-down) torque to be within the limit 6.0 to 20 lbf in. (0,68 to 2,26 N.m).
  - (b) Nominal tightening torque between 170 and 190 lbf in. (19,2 and 21,5 N.m).
- (4) Remove the lifting equipment from the FCU.
- (5) Remove the hand-turning tool and loosely assemble the cover to the right-hand gearbox, secure using bolts and washers.

3. Assemble Actuator Gearbox to FCU (Ref. Item 3, Fig.501 of Stage 1)

A. Prepare for Assembly.

- (1) Ensure that the type and serial number are recorded on the accessory sheet.
- (2) Ensure that inhibiting fluid has been drained from the gearbox.
- (3) Carry out a torque check on the actuator gearbox drive (Ref.Fig.504, Sheet 1).
  - (a) Remove seal drains connection union and strainer assembly and sealing washer and expose indicator scale.
  - (b) Assemble adapter (Tool 1750) and torque wrench to gearbox quillshaft.

OVERHAUL

- (c) Note the drive setting as indicated by the scale. The quillshaft is turned clockwise (looking on drive) to move indicator scale from zero to open.
  - (d) Within a limit of 4 lbf in., progressively apply a torque load to the drive shaft and turn the gearbox through its full range as indicated on the scale, 0 to 130 deg. Full movement must be obtained within the limit for the unit to be acceptable.
  - (e) Install the union and strainer assembly temporarily to the actuator gearbox.
- (4) Assemble serviceable seal plate (77244694) to actuator gearbox mounting face and secure it with two screws (77244690). Ensure that screws do not project above seal plate face.

#### B. Install Actuator Gearbox.

**CAUTION:** IT IS OF UTMOST IMPORTANCE THAT THE SHAFT STRAIGHTNESS AND SPLINE ALIGNMENT CHECKS (REF. Para.B(1) and (2)) ARE CARRIED OUT BEFORE INSTALLATION OF THE ACTUATOR GEARBOX TO THE FCU. SERIOUS OPERATIONAL PROBLEMS MAY OCCUR IF THESE CHECKS ARE NOT CARRIED OUT.

- (1) Check shaft straightness (Ref. Fig.504, Sheet 2).
  - (a) Using the dial test indicator (DTI), check the run-out of the throttle actuator drive shaft when it is rotated from "stop to stop". The maximum allowable run-out of the shaft is 0.003 in. (0.0762 mm).
  - (b) If the run-out is more than the allowable value, the fuel control unit must be rejected.

- (d) Turn FCU stop plate coupling to align master spline with gauge shaft master spline.

CAUTION: DO NOT FORCE GAUGE SHAFT INTO ENGAGEMENT WITH THE FCU STOP PLATE COUPLING.

- (e) Locate gauge dowels with FCU dowel holes and ensure that gauge shaft readily engages with FCU stop plate coupling. If difficulty is experienced, remove gauge, re-check alignment of master splines and re-attempt engagement. Repeat this operation as necessary.

- (f) Remove gauge from FCU.

- (2) Carefully engage splines and dowels and press actuator gearbox into position on FCU by hand pressure. If difficulty is experienced in engagement repeat the alignment procedure detailed in paragraph (1).
- (3) Hold actuator gearbox in position with FCU mating face and seal plate in full contact and retain in position with six bolts lightly tightened.
- (4) Secure actuator gearbox with six bolts (GTS 209-8 and washers GTS 51-8H) torque-tightened to 86 lbf in. (9,7 N.m). Ensure bolts are progressively tightened to avoid seal distortion.

4. Install First Stage Fuel Pump and Fuel Heater Assembly  
(Ref. Item 4, Fig.501 of Stage 1)

A. General.

The following procedure relates to an assembly of first stage fuel pump (73-11-01/1-10) and fuel heater (73-14-01/1-10), together with fuel inlet elbow, pressure switches and servo fuel tube section.

B. Prepare for Installation.

- (1) Ensure that the type and serial number are recorded on the accessory sheet.

- (2) Prepare the quick attach/detach coupling and its bolt and spherical washer (72-62-01/2-10-20). For details of preparation and assembly with lubrication of toroidal sealing ring, refer to 71-09-00 Assembly.

C. Install the Assembly (Ref.Fig.505).

- (1) Locate a serviceable toroidal sealing ring (72-62-01/2-100) in the groove of the coupling ring retaining flange on the left-hand gearbox.
- (2) Raise assembly into position on gearbox. Align assembly pins with their locations and dispose coupling ring with its thread sections facing slots on threaded flange. Position the spherical nut trunnion to tighten to the clamping bolt trunnion when threads are engaged.
- (3) Align driving shaft splines, ensure that sealing ring is not displaced, and press assembly squarely in position until joint faces abut.
- (4) Turn coupling ring counter-clockwise, in direction to bring trunnions together, and engage threads of ring with those of threaded flange as far as possible by hand.

**CAUTION:** ENSURE THAT THE THREADS HAVE ENGAGED FREELY BEFORE APPLYING TIGHTENING FORCE TO THE RING.

- (5) Position spherical washer on clamping bolt, then insert bolt through fixed locking trunnion to engage threads of spherical nut of coupling ring trunnion by hand.
- (6) Tighten the coupling ring in accordance with the procedure given in 72-09-00, Assembly, QAD Coupling Installation. Use the following locking (run-down) torque and torque-tightening values for the clamping bolt.
  - (a) Locking (run-down) torque to be within the limit 6.0 to 20 lbf in. (0,68 to 2,26 N.m).

- (b) Nominal tightening torque between 170 and 190 lbf in. (19,2 and 21,5 N.m).

- (7) Install heater and filter support bracket.

**CAUTION:** ENSURE ATTACHMENT BOLTS AND THEIR CORRESPONDING THREADED HOLES ARE TO THE SAME SERVICE BULLETIN STANDARD.

- (a) Apply lubricant 'B' to the bolts.
- (b) On engine to pre SB.73-37 standard (Ref.Fig.505), assemble bracket (73-14-01/1-170) and locatig plate (73-14-01/1-60) to heater and filter and secure with bols (73-14-01/1-40) and washers (73-14-01/1-50) lightly tightened.
- (c) On engines to SB.73-37 standard (RefFig.5) assemble bracket (73-14-01/1-170) and distance piece (73-14-01/1-77) to heater and filter and secure with bolts (73-14-01/1-73) and washers (73-14-01/1-75) lightly tightened.
- (d) Secure support bracket, together with plate (73-14-01/1-160), to bracket on main oil pump, with bolts (73-14-01/1-150) lightly tightened.

**NOTE:** If bracket serrations do not align, loosen bracket retaining bolts, manipulate bracket until serrations align.

- (e) Torque-tighten the bolts, between 85 and 95 lbf in. (9,6 and 10,7 N.m).

5. Assemble the Support Tubes to Lower Section of CCOC  
(Ref. Item 5, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to securing bolts.
- (2) Ensure that the minimum locking (run-down) torque of the nuts is 10 lbf in. (1,1 N.m).

OLYMPUS 593

B. Install the Tubes (Ref.Fig.506).

- (1) Insert each tube in turn into the respective plate mounting (72-53-00/6-260-440 and /7-80) on the diffuser, turbine exhaust outer case flange.
- (2) Secure the left-hand position tube (72-42-01/1-290) to the pillar bolts on the CC0C/HP compressor diffuser case flange with nuts (72-42-01/1-300). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (3) Secure the right-hand position tube (72-42-01/1-270) to the pillar bolts on the CC0C/HP compressor diffuser case flange with nuts (72-42-01/1-280). Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (4) Secure the centre position tube (72-42-01/1-230) to the bracket (72-42-02-190) attached to the internal inspection port.
  - (a) Place the bracket (72-42-01/1-260) on the rear face of the inspection port bracket.
  - (b) Secure the brackets and tube with bolts and nuts (72-42-01/1-250-240).
  - (c) Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (5) Assemble the pillar bolt (72-42-01/1-220) to the lug located near the rear of the bottom tube.
  - (a) Position the bolt so that it protrudes outward.
  - (b) Secure it with a nut (72-42-01/1-210).

- (c) Torque-tighten the nut to 100 lbf in.  
(11,5 N.m).

6. Install Fuel Drains Tank (Ref. Item 6, Fig.501 of Stage 1)

A. Assemble Overflow Valve to Air/Fuel Separator Body  
(Ref.Fig.507).

- (1) Apply lubricant 'A' to the valve housing (71-73-01/2-115).
- (2) Insert the sealing valve and spring into the valve housing (71-73-01/2-130B-110-115).
- (3) Assemble the spring, sealing valve and valve housing in the valve body (71-73-01/2-135).
- (4) Depress the valve and secure the assembly with the retaining ring (71-73-01/2-95) in the valve body.
- (5) Assemble the valve body into the overflow vent body (71-73-01/2-80B).
- (6) Apply lubricant 'B' to the bolts.
- (7) Assemble the overflow vent body.
  - (a) Install the filter (71-73-01/2-120) into the separator body.
  - (b) Position the gasket (71-73-01/2-85) to the separator body joint face.
  - (c) Position and secure the overflow vent body (71-73-01/2-80B) to the separator body ensuring the gasket is correctly positioned between the joint faces.
  - (d) Retain the overflow vent body to the separator body with three bolts (71-73-01/2-70B) lightly tightened.

- (8) Secure the remaining positions on the flanges with the bolts and nuts (71-73-01/2-60B-50).
- (9) Torque-tighten the bolts and nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (10) Wire-lock the three bolts together.
- (11) Assemble the adapter union (71-73-01/2-140) to the overflow vent body.
  - (a) Apply lubricant 'A' to the union threads.
  - (b) Screw the union in position and torque-tighten to between 300 and 330 lbf in. (33,9 and 37,3 N.m).
- (12) Assemble the connector (71-73-02/5-590) adapter (71-73-02/5-580) and seal washers (71-73-02/5-600) to the overflow vent body.
  - (a) Apply lubricant 'A' to the connector fitting and adapter.
  - (b) Position a seal washer each side of the connector fitting, align and secure the assembly to the valve body with the adapter bolt.
  - (c) Torque-tighten the bolt to between 240 and 260 lbf in. (27,1 and 29,4 N.m).
- (13) Assemble the seal plate (71-73-01/2-30) to the overflow valve body.
  - (a) Apply lubricant 'B' to the bolts (71-73-01/2-20).
  - (b) Position the sleeve (71-73-01/2-40) and the seal plate on the valve body and loosely retain the plate with the bolts and nuts (71-73-01/2-10).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) Assemble the restraining fixture (Tool 940) to the seal plate to hold the bolts in position.
- (d) Torque-tighten the nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (e) Check each bolt head to ensure that it is 0.005 to 0.015 in. (0,127 to 0,381 mm) below the surface of the seal plate.

B. Assemble Mounting Brackets to Engine.

- (1) Apply lubricant 'B' to securing bolts.
- (2) Position the bracket (71-73-01/1-150) between the centre and left-hand support tubes on the CCOC. Secure the bracket to the two brackets located at the rear end of each support tube with bolts and nuts (71-73-01/1-170-160).
- (3) Torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Position the fuel drains tank mounting bracket (71-73-01/1-140) to the bracket and secure with bolts and nuts (71-73-01/1-130-120), install the bolt (71-73-01/1-80) in the mounting bracket pre-SB.71-14. Position the bolthead trap (71-73-01/1-135) to the bracket upper face, position the bolt in the mounting bracket (71-73-01/1-80-140) and the mounting bracket to the lower face of the bracket locating the bolt-head in the bolthead trap SB.71-14. Secure the assembly with bolts and nuts (71-73-01/1-130-120).
- (5) Torque-tighten the nuts to between 36 and 40 lbf in. (4,1 and 4,5 N.m), locking (run-down) torque 2.0 lbf in. (0,23 N.m).
- (6) Loosely assemble the mounting link (71-73-01/1-60) to the bracket attached to the left-hand support tube.
  - (a) Retain the bracket with a bolt and nut (71-73-01/1-50-40).

OVERHAUL

- (7) Loosely assemble the bracket (71-73-01/1-30) to the bracket on the centre CCOC support tube.

- (a) Retain the link with a bolt and nut (71-73-01/1-20-10).

C. Install Fuel Drains Tank.

- (1) Apply lubricant 'B' to the securing bolts.
- (2) Position the tank on the engine and secure as follows.
  - (a) Secure the rear position of the tank to the mounting with a bolt and nut (71-73-01/1-80-70). On pre-SB.71-14 position the nut on the underside of the mounting after inserting the bolt.
  - (b) Secure the left-hand position of the tank to the link with a bolt and nut (71-73-01/1-55-40).
  - (c) Secure the bottom position of the tank to the bracket with two bolts and nuts (71-73-01/1-20-10).
  - (d) Torque-tighten the nuts (securing the tank and brackets) to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Assemble the drain plug and sealing washer (71-73-01/1-100-110) to the tank.
  - (a) Apply lubricant 'A' to the plug. Screw the plug and washer in position on the tank. Torque-tighten the plug to between 230 and 250 lbf in. (26,0 and 28,2 N.m). Use torque wrench (Tool 1648). Wire-lock the plug.
- (4) Assemble protector (71-73-01/2-240) to the overboard vent flange.

7. INSTALL HP Turbine Cooling Air Ducts to HP compressor Diffuser Case and HP Compressor Case (Ref. Item 7, Fig.501 of Stage 1)

A. Install Ducts at Bottom Position (Ref.Fig.508).

- (1) Apply lubricant 'C' to all bolts unless stated otherwise.
- (2) Assemble a seal ring (75-01-04/1-190) to each end of duct (75-01-04/180). Insert the duct into the duct assembled to the diffuser case.
- (3) Slide the duct (75-01-04/1-10) over the seal ring on the connecting duct and align the flange with the location on the HP compressor case.
- (4) Assemble the brackets.
  - (a) Secure the bracket (75-01-04/1-50) with the bolts (75-01-04/1-30-40) to the left forward side of the duct flange.
  - (b) Secure the bracket (75-01-04/1-60) with the bolts (75-01-04/1-20) to the right forward side of the duct flange.
  - (c) Secure the mounting bracket (75-01-04/1-70) with the bolts (75-01-04/1-80) to the duct flange.

C. Install Scavenge Tube Front Section (72-01-04/1-160)  
(Ref.Fig.510).

- (1) Position the tube on the engine and engage the union nut with the scavenge flange adapter.
- (2) Assemble the loop-clamps to the brackets (72-22-01/4-240) mounted to the lower section of the air intake case flange and (72-31-01/4-430) mounted to the LP compressor case front blow-off flange and to the tube.
  - (a) At the front position common to the oil feed tube, temporarily secure the oil scavenge tube with loop-clamp (72-01-04/1-10) and lightly tighten.
  - (b) At the rear position common to the oil feed tube, secure the oil scavenge tube with loop-clamp (72-01-04/1-90). Torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the blank (72-01-04/1-80).
  - (a) Position the gasket (72-01-04/1-85) and blank to the tube flange.
  - (b) Position the bracket (72-01-04/1-70) on the flange blank.
  - (c) Secure the bracket, gasket and flange with the bolts (72-01-04/1-50-60), torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and wire-lock.

D. Install Scavenge Tube Rear Section (72-01-04/1-240)  
(Ref.Fig.510).

- (1) Position the tube on the engine and loosely engage the tube union nut with the front tube. Insert a gasket (72-01-04/1-255) between the tube flange and pump. Loosely secure the flanges together with bolts (72-01-04/1-250).

- (2) Assemble the loop-clamp (72-01-04/1-170) to the position common to the oil feed tube.
  - (a) Ensure that the distance piece (72-01-03/1-220) and existing loop-clamp are correctly positioned.
  - (b) Torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Torque-tighten the tube flange bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Torque-tighten both tube union nuts to between 310 and 340 lbf in. (35,0 and 38,4 N.m). (Tools 1565, 1648 and 322). Wire-lock the unions.
- (5) Assemble the bracket (72-01-04/1-230) to the bracket on the forward end of the tube (72-01-04/1-240). Install the bolts and nuts (72-01-04/1-220-210). Torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

E. Assemble Filter to Oil Scavenge Tube (Ref.Fig.510).

- (1) Assemble the blanking ferrule to the union nut and secure it with a circlip (72-01-01/1-40-30-20).
- (2) Insert the filter into the scavenge tube and retain it with the ferrule and union nut assembly. Torque-tighten the union nut to 500 lbf in. (56 N.m). (Tools 1526 and 946).
- (3) Wire-lock the union nut.

F. Assemble the Pillar Bolt.

- (1) Assemble the pillar bolt (71-51-01/4-110) to the bracket (72-31-01/5-410) on the LP case rear blow-off flange below and to the rear of the oil tank.

D. Install Left-hand Tube Section.

- (1) Position the tube (75-02-09/1-50) on the engine and loosely engage the tube union nuts with the flanged connector and adapter on the intake case.
- (2) Assemble a loop-clamp (75-02-09/1-10) to the tube and secure the clamp to the LP Compressor Oil feed and scavenge pipe bracket (72-22-01/4-240) using the existing pillar bolt and clipnut (72-01-03/1-90-110).
- (3) Torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Torque-tighten the pipe union nuts to between 220 and 240 lbf in. (24,8 and 27,1 N.m).
- (5) Wire-lock the union nuts.

10. Installation of Fuel Manifolds and Feed Tubes (Ref. Item 11, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the union threads and lubricant 'B' to the bolt threads.

B. Assemble the Fuel Manifold (Ref.Fig.512).

- (1) Position the top section of the manifold (73-12-04/1-150) and loosely secure to the four pair of sprayer unions.
- (2) Position the bottom section of the manifold (73-12-04/1-300) and loosely secure to the four lower pair of sprayer unions.
- (3) Assemble the manifold unions, top to bottom.
- (4) Assemble a loop-clamp (73-12-04/1-80) to each end of the top manifold. Secure the right-hand clamp to the upper position of the double bracket (72-33-01/8-200) and the left-hand clamp to the single bracket (72-33-01/8-380) on the HP case/delivery case flange with bolts, washers and nuts (73-12-04/1-110-100-90).

- (5) Torque-tighten the loop-clamp nuts and bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (6) Assemble two loop-clamps (73-12-04/1-10) at the top position of the top manifold and secure with bolts, washers and nuts (73-12-04/1-40-30-20) to the bracket (72-33-01/8-170) mounted on the HP casing/delivery casing flange.
  - (7) Assemble a loop-clamp (73-12-04/1-230) to each end of the bottom manifold. Secure the right-hand clamp to the lower position of the double bracket (72-33-01/8-200) and the left-hand clamp to the single bracket (72-33-01/8-350) on the HP casing/delivery casing flange with bolts, washers and nuts (73-12-04/1-260-250-240).
  - (8) Assemble the two loop-clamps (73-12-04/1-160) to the lower position of the bottom manifold and secure with bolts, washers and nuts (73-12-04/1-190-180-170) to the bracket (72-33-01/8-280) mounted on the HP case/delivery case flange.
  - (9) Torque-tighten the loop-clamps, nuts and bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (10) Torque-tighten the manifold to sprayer union nuts to between 250 and 280 lbf in. (28,2 and 32,0 N.m).
  - (11) Torque-tighten the manifold unions joining the top and bottom sections to between 280-310 lbf in. (31,6 and 35,0 N.m).
  - (12) Wire-lock all unions.
- C. Assemble Upper and Lower Main Feed Fuel Tubes.
- (1) Upper fuel tube (73-13-02/2-160).
    - (a) Position the tube to the left-hand side of the engine, connect the upper end to the union on the top of the top manifold assembly, hand-tighten only.

- (b) Assemble two loop-clamps (73-13-02/2-10-80) to the tube and secure with bolts, washers and nuts (73-13-02/2-40-110-30-100-20-90) to the brackets (72-33-01/7-230-290) mounted on the HP casing/delivery casing flange.
  - (c) Torque-tighten the nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Lower fuel tube (73-13-02/2-270).
- (a) Position the tube to the bottom of the engine, connect the one end to the union at the lowest point of the bottom manifold, finger-tighten only.
  - (b) Assemble a loop-clamp (73-13-02/2-190) to the tube and secure with a bolt, washer and nut, (73-13-02/2-220-210-200) to a bracket (72-33-01/8-320) mounted on the HP case/delivery case flange.
  - (c) Torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

NOTE: The tubes unions at the manifolds are tightened after installation of the distribution and dump valve, ref. para.41.

11. Install Oil Cooler and Mounting (Ref. Item 12, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to nuts and bolts (72-33-01/8-50-60-80-90) securing the brackets (72-33-01/8-70-100). Apply lubricant 'B' to the remaining bolt threads.
- (2) Record the type and serial number of the oil cooler on the accessory sheet.

B. Assemble Cooler Rear Brackets (Ref.Fig.513).

- (1) Position the bracket (72-33-01/8-70) to the HP case.
- (2) Install the D-headed bolts and nuts (72-33-01/8-60-50).

- (3) Torque-tighten the nuts to 100 lbf in. (11,5 N.m).  
Locking (Run-down) torque 10 lbf in. (1,1 N.m).
- (4) Position the bracket (72-33-01/8-100) to the HP case.
- (5) Install the D-headed bolts and nuts (72-33-01/8-90-80).
- (6) Torque-tighten the nuts to 100 lbf in. (11,5 N.m).  
Locking (Run-down) torque 10 lbf in. (1,1 N.m).
- (7) Ensure there is a minimum clearance of 0.150 in. (3,75 mm) between the cooler lower rear mounting bracket and the fuel manifold stem.

C. Assemble the Oil Cooler.

- (1) Position the oil cooler on the engine.
- (2) Install the flanged pin (79-21-01/1-120) through the lower bracket on the HP case (from the rear) and the oil cooler lower rear mounting lug.
- (3) Insert the bolt (79-21-01/1-110) through the flanged pin from the rear and secure with a washer and nut (79-21-01/1-100-90).
- (4) Assemble the link.
  - (a) Position the link (79-21-01/1-250) to the upper bracket (72-33-01/8-100).
  - (b) Insert the D-headed bolt (79-21-01/1-240) and secure with nut (79-21-01/1-230).
  - (c) Install the flanged pin (79-21-01/1-80) to the link and oil cooler upper rear mounting lug.
  - (d) Insert the bolt (79-21-01/1-70) and secure.
  - (e) Torque-tighten the oil cooler rear securing bolts and nut to between 170-190 lbf in. (19,2 and 21,5 N.m). Locking (Run-down) torque 6.5 lbf in. (0,73 N.m).

OVERHAUL

- (5) Install the front mounting flanged pin.
- (a) Install the flanged pin (79-21-01/1-40) from the rear.
  - (b) Fit the washer to the retaining bolt (79-21-01/1-30-20).
  - (c) Install the bolt into the flanged pin and lightly tighten the bolt.
  - (d) With feeler gauges check the gap between the front of the oil cooler front mounting lug and the mounting bracket (72-33-01/4-60).
  - (e) Select a shim (79-21-01/1-60) of equivalent thickness.
  - (f) Remove the bolt and washer.
  - (g) Withdraw the flanged pin sufficiently to slide the selected shim between the front of the oil cooler front mounting lug and the mounting bracket. Push the flanged pin into the mounting.
  - (h) Refit the washer and bolt (79-21-01/1-30-20).
  - (j) Torque-tighten the bolt to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).

12. Install the Oil Feed and Return Tubes. IDG to Oil Cooler  
(Ref. Item 13, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Lubricate the tube union threads with lubricant 'A' and the bolts with lubricant 'B'.

B. Assemble the Setting Gauge to the IDG Mounting on the Right-hand Gearbox (Ref.Fig.514).

OVERHAUL

- (1) Locate the setting gauge (Tool 58) on the IDG QAD coupling ensuring the dummy connectors are correctly orientated.
- (2) Secure gauge with the QAD coupling.

C. Assemble the Tubes.

- (1) Cooler upper rear tube.
  - (a) Position the gasket (79-22-04/2-350) and the tube (79-22-04/2-330) to the oil cooler upper rear mounting face.
  - (b) Install the bolts (79-22-04/2-340) and torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the loop-clamp (79-22-04/2-260) to the tube and secure with a bolt, washer and nut (79-22-04/2-290-280-270) to the bracket (75-02-12/1-30) mounted to the venting air tube flange. Torque-tighten the nut and bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the loop-clamp (79-22-04/2-200) to the tube. Secure the clamp to the tube using pillar bolt (71-51-01/10-130), washer and nut (79-22-04/2-220-210) align with the bracket (72-33-01/8-280) mounted on the HP case/delivery case flange. Lightly tighten the nut and bolt.
- (4) Install a pillar bolt (79-22-04/2-40) to the rear face of the bracket (72-33-01/7-200) mounted to the lower left HP case rear joint flange. Secure the pillar bolt with a washer and nut (79-22-04/2-30-20), torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Install the pillar bolt (79-22-04/2-110) to the rear face of the bracket (72-33-01/7-170) mounted to the bottom HP case rear joint flange. Secure the pillar bolt with a washer and nut (79-22-04/2-100-90), torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (6) Cooler rear tube, lower.
- (a) Position the gasket (79-22-04/2-190) and the tube (79-22-04/2-150) to the oil cooler lower rear mounting face.
  - (b) Position the bracket (79-22-04/2-180) to the tube flange.
  - (c) Secure the bracket and tube with bolts (79-22-04/2-170-160), torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Assemble the two loop-clamps (79-22-04/2-10-80) to the tube align them with the pillar bolts previously fitted to the brackets mounted to the lower left HP casing rear joint flange (ref. para.4 and 5). Secure the loop-clamps to the pillar bolts with washers and nuts (79-22-04/2-30-100-20-90), torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) IDG tubes to oil cooler tubes.
- (a) Position the tube (79-22-04/1-240) to the inner position on the setting gauge, mounted to the IDG QAD coupling and to the union of the forward tube secured to the oil cooler. Lightly tighten the unions.
  - (b) Position the tube (79-22-04/1-230) to the outer position on the setting gauge and to the union of the rear tube secured to the oil cooler. Lightly tighten the unions.
- (9) Assemble two loop-clamps (79-22-04/1-10) to the IDG tubes.
- (a) Align the clamps with the bracket (72-63-01/8-170) mounted on the rear of the right-hand gearbox.
  - (b) Secure the two loop-clamps to the bracket with the bolt, washer and nut (79-22-04/1-40-30-20).

- (c) Torque-tighten the nut and bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (10) Assemble two loop-clamps (79-22-04/1-80) to the IDG tubes.
  - (a) Align the clamps with the bracket (72-33-01/5-130) secured to the bottom centre of the HP casing.
  - (b) Install the clipnut (79-22-04/1-110) to the bracket.
  - (c) Secure the loop-clamps to the bracket with the washer and bolt (79-22-04/1-100-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (11) Assemble two loop-clamps (79-22-04/1-150) to the IDG tubes.
  - (a) Align the clamps with the bracket (72-33-01/7-140) mounted to the HP casing rear flange.
  - (b) Install the clipnut (79-22-04/1-190) to the bracket.
  - (c) Secure the loop-clamps to the bracket with the distance piece, washer and bolt (79-22-04/1-180-170-160). Lightly tighten the bolt.
- (12) Lightly tighten the union nuts to the setting gauge. Ensure a minimum clearance of 0.050 in. (1,25 mm) between the elbow of the pipe (79-22-04/1-240) and the gearbox casing.
- (13) Torque-tighten the tube unions to between 400 and 440 lbf in. (45,2 and 49,7 N.m). (Tools 948, 1753 and 1648). Wire-lock the union nuts.

TN17872

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (14) Release the tube union nuts from the setting gauge and remove the gauge from the gearbox.
- (15) Release and remove the bolt, sleeve, quillshaft and seal rings from the IDG drive shaft in the gearbox.
- (16) Assemble the seal (72-63-01/8-30) to the gearbox QAD flange.
- (17) Refit the bolt and sleeve to the IDG drive shaft, torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

NOTE: Ensure the quillshaft and seal rings are suitably protected and packed for transportation with the engine.

- (18) Blank the IDG location on the gearbox (Tool 650).
- (19) Assemble the QAD nut (Ref.71-09-00 Assembly), rotate to engage the threads and secure. Install spherical washer and bolt through the retaining bracket to the QAD nut. Torque-tighten the bolt to between 170 and 190 lbf in. (19,2 and 21,5 N.m). Locking (run-down) torque 6.5 and 60 lbf in. (0,68 and 6,8 N.m).

13. Assemble the Oil Return Tube from the Oil Cooler to the Oil Tank (Ref. Item 14, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the securing bolts.

B. Installation (Ref.Fig.515).

- (1) Position the gasket (79-22-02/3-200) and the oil tube (79-22-02/3-150) to the mounting flange at the top rear face of the oil tank.
- (2) Secure the oil tube and gasket with the bolts (79-22-02/3-160) torque-tightened to between 80 and 90 lbf in. (9,0 and 10,2 N.m).

OVERHAUL

- (3) Position the gasket (79-22-02/3-210) and the oil tube to the inner front oil cooler mounting face.
- (4) Secure the oil tube and gasket with the bolts (79-22-02/3-170-180) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Ensure there is a minimum clearance of 0.050 in. (1,25 mm) between the tube and the oil tank top rear mounting bracket
- (6) Assemble the loop-clamp (79-22-02/3-10) to the oil tube align with the bracket (72-31-01/5-530) mounted on the LP casing flange.
- (7) Secure the loop-clamp to the bracket with the bolt, washer and nut (72-22-02/3-40-3-20) torque-tightened to between 85 and 9 lbf in. (9,6 and 10,7 N.m).
- (8) Assemble the loop-clamp (79-22-02/3-80) and the half clamp shells (79-22-02/3-145) (SB.0L.593-75-8972-27 standard) to the oil tube align with the bracket (72-33-01/6-440) mounted on the HP compressor case.
- (9) Secure the loop-clamp to the bracket with the bolt, washer and nut (79-22-02/3-110-100-90) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

14. Assemble the Sump Vent Tube, Sump to Oil Return Tube  
(Ref. Item 15, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube unions and lubricant 'B' to the bolt threads.

B. Installation (Ref.Fig.516).

- (1) Assemble the top tube (79-22-02/4-180) to the rear union of the oil return tube, oil tank to the oil cooler, above the LH gearbox, and tighten the tube union nut hand-tight.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) Assemble the bottom tube (79-22-02/4-80) between the top tube and the sump mounting face.
  - (a) Assemble tube union nut finger-tight.
  - (b) Position the gasket (79-22-02/4-100) between the bottom tube mating face and the sump mounting face.
  - (c) Secure the tube and gasket to the sump with bolts (79-22-02/4-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the clipnut (79-22-02/4-40) to the bracket (72-32-00/6-55) on the intermediate case boss.
- (4) Assemble the loop-clamp (79-22-02/4-10) to the bottom tube aligning with the bracket (72-32-00/6-55) on the intermediate case boss.
- (5) Secure the loop-clamp to the bracket with the bolt and washer (79-22-02/4-20-30) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Assemble the loop-clamp (79-22-02/4-110) to the top of the bottom tube, align with the bracket (72-33-01/6-380) on the intermediate/HP case flange.
- (7) Secure the loop-clamp to the bracket with the bolt washer and nut (79-22-02/4-140-130-120) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) Torque-tighten the tube union nuts to between 280 and 310 lbf in. (31,6 and 35,0 N.m) (Tool 1648 and 908) and wire-lock them.

15. Assemble the Oil Tank Front and Centre Overboard Vents  
(Ref. Item 16, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to all the tube union threads and lubricant 'B' to all bolts except in the one case stated.

B. Installation (Ref.Fig.517).

- (1) Install the seal ring (75-02-02/1-460) to the front tube (75-02-02/1-450).
- (2) Position the front tube locating the seal in the vent housing mounted near the top of the tank.
- (3) Apply lubricant 'A' to the bolts (75-02-02/1-430).
- (4) Assemble the retaining plate (75-02-02/1-440) to the vent housing. Install the bolts and torque-tighten to between 36 and 40 lbf in. (4,1 and 4,5 N.m).
- (5) Wire-lock the bolts.
- (6) Assemble the loop-clamp (75-02-02/1-360) to the tube and attach to the bracket (72-31-01/5-560) mounted on the LP case rear blow-off elbow with bolt, washer and nut (75-02-02/1-390-380-370).
- (7) Assemble the loop-clamp (75-02-02/1-360) to the tube and attach to the bracket (72-31-02/2-210) mounted on the exit guide blade/intermediate case flange with bolt, washer and nut (75-02-02/1-390-380-370).
- (8) Remove two bolts from the oil cooler forward lower blanked flange. Assemble the bracket (79-21-01/1-220) and secure to the blanked flange with bolts (79-21-01/1-210). Torque-tighten the bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

- (9) Position the centre tube (75-02-02/1-270) to the engine secure the union between the front and centre tubes hand-tight.
  - (10) Assemble the loop clamp (75-02-02/1-200) to the centre tube and attach to the bracket (72-33-01/6-410) mounted on the intermediate case/HP case flange with bolt, washer and nut (75-02-02/1-230-20-210).
  - (11) Torque-tighten the loop-clamps bolts and nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (12) Assemble the loop-clamp (75-02-02/1-130) to the centre tube and attach to the bracket (79-21-01/1-220) fitted to the oil cooler with bolt, washer and nut (75-02-02/1-160-150-140). Lightly tighten the bolt and nut.
  - (13) Torque-tighten the tube union nut to between 50 and 55 lbf ft (68 and 74 N.m) and wire-lock the union. (Tools 948, 1529 and 1656).
16. Assemble the Left-hand Gearbox Vent Tube (Ref. Item 17, Fig.501 of Stage 1)
- A. Prepare for Installation.
    - (1) Apply lubricant 'A' to the union threads and lubricant 'B' to the bolt threads.
  - B. Installation (Ref.Fig.517)
    - (1) Position the tube (75-02-02/1-350) to the engine. Secure the forward tube union to the flanged connector at the top of the left-hand gearbox and the rear union to the elbow in the oil tank lower vent line forward of the oil cooler, finger-tighten the tube unions
    - (2) Assemble the loop-clamp (75-02-02/1-280) and the half clamp shells (75-02-02/1-345) (SB.OL.593-75-8972-27 standard) to the tube align with the bracket (72-62-01/7-190) mounted on the gearbox. Secure the loop-clamp to the bracket with bolt, washer and nut (75-02-02/1-310-300-290).

ASSEMBLY

## 71-00-01

STAGE 2

Page 552

Jun 1/94

OLYMPUS 593

MK.610-4-28

OVERHAUL

- (3) Torque-tighten the loop-clamp bolt and nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Torque-tighten the union nuts to between 280 and 310 lbf in. (31,6 and 35,0 N.m) (Tools 908 and 1664).

- (4) Wire-lock the union nuts.

17. Assemble the Oil Container and Oil Scavenge Tube from the Main Oil Pump to the Oil Cooler (Ref. Item 18, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolt threads.

B. Installation (Ref.Fig.518).

- (1) Assemble the gasket and container (79-22-02/1-30-10) to pump housing mounting face.
- (2) Secure the container and gasket to the pump with bolts (79-22-02/1-20). Torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Identify the position of the tube on the engine and insert the bolts (79-22-02/1-240-250) in the bottom flange of the tube (79-22-02/1-190), the two longer bolts positioned in the forward two holes in the flange.
- (4) Secure the bolts in the flange with the retaining rings (79-22-02/1-230).
- (5) Position the gasket (79-22-02/1-40) on the upper mounting flange of the oil container.
- (6) Install the tube on the mounting flange. Position the bracket (79-22-02/1-270) on the two forward longer bolts under the container flange.
- (7) Locate the assembly with the nuts (79-22-02/1-220) lightly tightened.

TUBES AND ACCESSORIES - ASSEMBLY1. Assemble the Air Supply Ducts to the Second Stage Fuel Pump  
(Ref. Item 19, Fig.501 of Stage 1)

## A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.

## B. Installation (Ref.Fig.501).

- (1) Ensure that the upper and lower ducts (75-05-01/1-10-100) are to the same Service Bulletin standard.

- (2) On engines to pre-SB.75-8578-17 standard, assemble upper duct to lower duct.

- (a) Assemble sealing ring (75-05-01/1-90) to SB.75-4 standard to upper duct.

- (b) Assemble upper duct to lower duct, align the holes of the retaining plate with lower duct flange bolt-holes and retain with two bolts and nuts (75-05-01/1-50-40) lightly tightened.

- (3) On engines to SB.75-8578-17 or SB.75-8765-22 or SB.75-9013-28 standard, assemble upper duct to lower duct.

- (a) Assemble sealing ring to corresponding Service Bulletin standard to upper duct.

- (b) Assemble upper duct to lower duct.

- (c) Assemble retaining plate (75-05-01/1A-55) to duct flanged joint and retain it with two nuts and bolts (75-05-01/1-40-50) lightly tightened.

## C. Install Duct Assembly.

- (1) Assemble the sealing ring (75-05-01/1-140) on second stage pump duct. Assemble double-ended bolts (75-05-01/1-130) to duct and secure with washer and nut (75-05-01/1-120-110).

- (2) Position duct assembly on engine.

- (3) Secure upper duct to intermediate case elbow with three bolts and nuts (75-05-01/1-30-20) lightly tightened.

71-00-01

### STAGE 3

Page 502

Jun 1/96

OLYMPUS 503

MK.610-14-28

OVERHAUL

- (4) Slide lower duct downward over second stage pump duct and secure to double-ended bolts with two nuts (75-05-01/1-110) lightly tightened.
  - (5) Torque-tighten intermediate case elbow nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (6) Torque-tighten nuts securing lower duct to second stage pump duct to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (7) Secure upper duct to support bracket.
    - (a) Check that duct to bracket attachment bolt-holes align. If necessary, remove bracket from HP compressor case, assemble flat washers between bracket and case and secure with two bolts. If flat washers are not required to align bolt-holes, assemble a washer under each bolthead and lightly tighten bolts.
    - (b) Measure gap between duct support flange and support bracket. Select required number of flat washers (75-05-01/1-74-76), from set of four to fill gap.
- NOTE: There are two thicknesses of flat washer supplied to facilitate this task.
- (c) Assemble any remaining flat washers under head of bolt (75-05-01/1-80) and insert bolt through support bracket, ensure bolt locates flat washer(s), previously selected, between adjacent faces. Assemble flat washer (75-05-01/1-70) (countersunk) and nut (75-05-01/1-60) to bolt and lightly tighten.
  - (d) Torque-tighten support bracket to HP compressor case bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (e) Torque-tighten support bracket bolt and nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) On engines to pre-SB.75-8578-17 standard, dispose flange joint retaining plate centrally about the upper duct.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (a) Check that clearance between retaining plate and upper duct wall is equal all round.
  - (b) If necessary, slacken the attachment nuts and bolts, position retaining plate with upper duct central in the plate bore and lightly tighten attachment nuts and bolts.
  - (9) Torque-tighten retaining plate attachment nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
2. Install the Air Valve and Fuel Heating Tubes (Ref. Item 20, Fig.501 of Stage 1)
- A. Tubes, Delivery Casing to Air Valve.
- (1) Prepare for Installation.
    - (a) Apply lubricant 'B' to the bolts.
    - (b) Record the type and serial number of the air valve on the accessory sheet.
  - (2) Installation (Ref.Fig.502).
    - (a) Remove the temporarily assembled bolts, hollow pin and keep plate (75-03-01/3-250-260-270-280) from the elbow on the delivery case below the left-hand trunnion.
    - (b) Assemble the seal rings to each end of the tube (75-03-01/3-290-240).
    - (c) Position the tube in the elbow on the delivery casing.
    - (d) Secure the tube to the elbow with the keep plate, hollow pin and bolts. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
    - (e) Position the lower tube (75-03-01/3-400) to the previous tube (75-03-01/3-240) and secure the tube flange to the bracket (72-42-01/4-370) with bolts and nuts (75-03-01/3-420-410), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

- (f) Assemble the loop-clamp (75-03-01/3-300).
- (i) Position the loop-clamp to the tube, and align to the CCOC lower left-hand intra-scope position.
  - (ii) Position the bracket (75-03-01/3-390) to the loop-clamp.
  - (iii) Secure the loop-clamp and bracket with bolt, washers and nut (75-03-01/3-330-320-310).
  - (iv) Lightly tighten the nut.
- (g) Install the air valve.
- (i) Position the air valve in line with the tube rear flange.
  - (ii) Position the mounting bracket (73-14-02/1-90) to the forward face of the tube flange.
  - (iii) Secure the bracket and tube flange to the air valve with bolts (73-14-02/1-20).
  - (iv) Secure the bracket (73-14-02/1-120) to the flange on the support tube (72-42-01/1-290) with bolt and nut (73-14-02/1-110-100).
  - (v) Secure the bracket (73-14-02/1-120) to the tubes rear flange with the bolts (73-14-02/1-20).
  - (vi) Install the remainder of the tube flange bolts (73-14-02/1-20).
  - (vii) Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (h) Ensure a clearance of 0.100 in. (2,54 mm) exists between the tube and the left-hand trunnion mounting.
- (j) Ensure a clearance of 0.100 in. (2,54 mm) exists between the upper tube and the number five and six sprayer tubes.

3. Install Tubes from the Fuel Heater Inlet Elbow to the Air Valve (Ref. Item 20, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to all bolts.

B. Install Tubes (Ref.Fig.502).

- (1) Assemble the sealing rings to the seal ring carrier (75-03-01/1-100-90).
- (2) Locate the seal ring carrier into the heater inlet.
- (3) Assemble the elbow (75-03-01/1-130) to the seal ring carrier.
- (4) Assemble the sealing ring to the tube (75-03-01/1-250-210).
- (5) Assemble the tube to the elbow, positioning the elbow to the bracket (72-31-02/2-180).
- (6) Secure the tube retaining plate (75-03-01/1-240) and elbow to the bracket (72-31-02/2-180) with bolts and nuts (75-03-01/1-230-220). Torque-tighten the nuts and bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m)
- (7) Secure the sealing ring carrier retaining plate (75-03-01/1-80) to the elbow lug (72-31-02/2-180) with the bolt and nut (75-03-01/1-70-60). Secure the elbow to the bracket with bolt and nut (75-03-01/1-120-110). Torque-tighten the nut and bolt securing the retaining plate (and the nut and bolt securing the elbow and bracket) between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (8) Assemble the loop-clamp (75-03-01/1-140) and the half clamp shells (75-03-01/1-205) (SB.0L.593-75-8972-27 standard) to the tube align with the bracket (72-31-02/2-240) mounted to the exit guide vane/intermediate case flange. Secure the clamp to the bracket with bolt, washer and nut (75-03-01/1-170-160-150). Torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (9) Assemble a D-sealing ring to each end of the tube (75-03-01/2-120-80).
- (10) Position the tube to the engine and locate the forward end in the tube (75-03-01/1-210). Support the rear end.
- (11) Install the retaining plate and secure with bolts and nuts (75-03-01/2-110-100-90). Torque-tighten the nuts and bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (12) Assemble the loop-clamp and the half clamp shells (75-03-01/2-75) (SB.0L.593-75-8972-27 standard) to the tube (75-03-01/2-10-80) and secure to the bracket (72-33-01/6-470) on the intermediate case/HP case flange with bolt, washers and nut (75-03-01/2-40-30-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (13) Install the seal housing to the tube (75-03-01/2-150-80).
  - (a) Position the seal housing forward end over the tube and seal.
  - (b) Secure the tube and housing with retainer, bolts and nuts (75-03-01/2-110-100-90).
  - (c) Secure the housing to the bracket (72-33-01/7-320) mounted to the HP case joint face with bolts and nuts (75-03-01/2-140-130).
  - (d) Torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (14) Ensure a minimum clearance of 0.150 in. (3,75 mm) between the housing and the fuel manifold upper feed tube.

- (15) Install tube (75-03-01/2-230).
- (a) Assemble D-sealing rings to each end of the tube (75-03-01/2-270-230) and install the tube in the seal housing.
  - (b) Retain the tube in the housing with the retaining plate (75-03-01/2-260). Secure the housing to the bracket (72-33-01/8-410) with the bolts and nuts (75-03-01/2-250-240).
  - (c) Torque-tighten the nuts and bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (16) Assemble the loop-clamp (75-03-01/2-160) and the half clamp shells (75-03-01/2-225) (SB.0L.593-75-8972-27 standard) to the tube and attach it to the bracket (72-42-01/5-200) secured to the delivery case/CC0C flange. Secure the clamp to the bracket with bolt, washer and nut (75-03-01/2-190-180-170) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (17) Assemble the tube (75-03-01/3-150) to the tube (75-03-01/2-230). Install the retaining plate and secure with the bolts and nuts (75-03-01/2-260-250-240). Torque-tighten the nuts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (18) Assemble the loop-clamp (75-03-01/3-10) and the half clamp shells (75-03-01/3-75) (SB.0L.593-75-8972-27 standard) to the upper end of the tube and secure it to the bracket (75-03-01/3-180) mounted on the CC0C casing with bolt, washer and nut (75-03-01/3-40-30-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (19) Assemble the loop-clamp (75-03-01/3-80) and the half clamp shells (75-03-01/3-145) (SB.0L.593-75-8972-27 standard) to the lower end of the tube and secure it to the bracket (72-42-01/2-280) mounted on the CC0C casing with bolt, washer and nut (75-03-01/3-110-100-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (20) Assemble the elbow (75-03-01/3-190) to the valve rear mounting face and secure with bolts (73-14-02/1-20). Torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (21) Assemble the bracket (75-03-01/3-230) to the lower flange of the tube (75-03-01/3-150). Secure the bracket to the tube flange and the tube to the elbow with bolts and nuts (75-03-01/3-220-210-200). Torque-tighten the nuts and bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

C. Fuel Heater Overboard Duct (Ref. Item 20, Fig.501 of Stage 1).

- (1) Prepare for Installation.

(a) Apply lubricant 'B' to the bolts.

- (2) Installation (Ref.Fig.503).

(a) Ensure the piston ring (75-03-01/1-50) has been fitted to the heater outlet elbow.

(b) Assemble the tube (75-03-01/1-10) to the fuel heater outlet elbow. Retain with the special bolt (75-03-01/1-20). Torque-tighten the bolt between 80 and 90 lbf in. (9,0 and 10,2 N.m).

(c) Secure the support lug (72-31-01/4-370) to the tube with bolts (75-03-01/1-30). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(d) Assemble the support strut (72-31-01/4-330) to the lug, mounted on the tube, with bolt, washers and nut (72-31-01/4-360-350-340). Secure the support strut to the lug (72-31-01/4-440) mounted on the LP case front blow-off flange with bolt, washers and nut (72-31-01/4-360-350-340). Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

4. Install Vent Tubes, Intermediate Case Adapter to Aircraft Connection (Ref. Item 21 Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to union threads and lubricant 'B' to bolt threads.

# OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

## B. Installation (Ref.Fig.503).

- (1) Assemble the bracket (75-02-01/1-290) to the lug on the lower left-hand support tube (72-42-01/1-290) and retain with bolts and nuts (75-02-01/1-280-270).
- (2) Assemble the end fitting (75-02-01/1-240) to the bracket and retain with bolts and nuts (75-02-01/1-260-250).
- (3) Assemble the bracket (75-02-01/1-180) to the LP shaft signal system baseplate (76-21-01/1-110) mounted to the left-hand lower delivery case/CC0C flange and retain with bolts and nuts (75-02-01/1-170-160).
- (4) Torque-tighten the nut and bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Position the tube (75-02-01/1-80) to the connection at vane six of the intermediate case, attach and finger-tighten the union.
- (6) Assemble the loop-clamp (75-02-01/1-10) and the half clamp shells (75-02-01/1-75) (SB.0L.593-75-8972-27 standard) to the tube and secure it to the bracket (72-33-01/4-30) on the HP case, with bolt, washer and nut (75-02-01/1-40-30- 20) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Position tube (75-02-01/1-230) to the previous tube and end fitting, attach and lightly tighten the unions.
- (8) Assemble loop-clamps (75-02-01/1-90) and the half clamp shells (75-02-01/1-155) (SB.0L.593-75-8972-27 standard) to the tube align at the following positions:
  - (a) To the bracket (72-33-01/7-260) mounted on the HP case front/rear joint flange.
  - (b) To the bracket (72-33-01/8-380) mounted on the HP case/delivery case flange.
  - (c) To the bracket (79-22-04/2-180) mounted on the IDG oil tube and cooler flange.

OVERHAUL

- (d) To the brackets (75-02-01/1-180) and (76-21-01/2-110) mounted on the delivery case/CCOC flange.
  - (e) Attach each loop-clamp to the mounting bracket with bolts, washers and nuts (75-02-01/1-120-110-100). Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (9) Assemble the lower loop-clamp.
- (a) Remove the nut, washers and bolt (75-03-01/3-330-320-310) fitted loosely to the loop-clamp on the fuel heater pipe and bracket in front of the valve.
  - (b) Assemble the loop-clamp (75-02-01/1-190) and the half clamp shells (75-02-01/1-223) (SB.OL.593-75-8972-27 standard) to the lower end of the air venting tube align with the loop-clamp on the heater pipe.
  - (c) Attach the loop-clamps to the bracket (75-03-01/3-390) on the CCOC lower left-hand intrascope position with the bolt, washers and nuts (75-03-01/3-330-320-310) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (10) Torque-tighten all the pipe union nuts between 400 and 440 lbf in. (45,2 and 49,7 N.m). (Tools 1648, 947 and 1528).
- (11) Ensure the tube (75-02-01/1-230) has a minimum clearance of 0.100 in. (2,54 mm) with the oil cooler.
- (12) Wire-lock all the tube union nuts.
5. Install the Air Venting Tube, Intermediate Case Sump to Tube Connection (Ref. Item 22, Fig.501 of Stage 1)
- A. Prepare for Installation.
- (1) Apply lubricant 'A' to the union threads and lubricant 'B' to the bolts.

ASSEMBLY

OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

B. Installation (Ref.Fig.504).

(1) Position the tubes.

- (a) Position the front tube (75-02-11/1-50) to the connection by the number four vane, intermediate case (pulse probe and drive housing), lightly tighten the tube front union nut to the connection.
- (b) Position the rear tube (75-02-11/1-100) to the LP and HP thrust bearings overboard end fitment, lightly tighten the tube rear union nut to the connection and the front union to the front tube.

(2) Assemble two loop-clamps (75-02-11/1-10) and the half clamp shells (75-02-11/1-45) (SB.OL.593-75-8972-27 standard) to the front tube aligning with:

- (a) The bracket (72-33-01/4-230) supporting the fuel reheat tube on the HP case. Retain the clamp to the bracket with the bolt, washer and nut (72-01-03/5-120-110-100) lightly tightened.
- (b) The bracket (72-33-01/7-170) on the HP case front/rear joint flange. Secure the clamp to the bracket with the existing bolt, washer and nut torque-tightened to between 85 and 95 lbf in.

(3) Assemble the loop-clamp (75-02-11/1-60) and the half clamp shells (75-02-11/1-95) (SB.OL.593-75-8972-27 standard) to the rear tube align with the bracket (72-42-01/4-280) mounted on the delivery case/CCOC flange. Retain the clamp to the bracket with bolt, washers and nut (72-01-03/ 4-290-280-270) lightly tightened.

(4) Torque-tighten the tube union nuts between 310 and 340 lbf in. (35,0 and 38,4 N.m) (Tools 1648, 322 and 1565).

(5) Wire-lock the tube unions.

6. Install the Fuel Recirculation Valve (Ref. Item 23,  
Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.
- (2) Record the type and serial number of the 'Dunlop' recirculation valve on the accessory sheet.

B. Installation (Ref.Fig.505).

- (1) Position the valve between the brackets (72-31-01/5A-590) and (72-31-01/4-490) mounted on the left-hand side of the LP case front blow-off flange and the lug to the rear of the flange.
- (2) Retain the valve to the rear bracket with bolts and washers (73-12-01/1-40-50). Install a bolt and washer to the upper and lower positions of the bracket.
- (3) Secure the valve to the forward bracket with bolt, pillar bolt and washers (73-12-01/1-40-55-50). Install the bolt and washer to the upper position and pillar bolt and washer to the lower position of the bracket.
- (4) Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (5) Wire-lock the bolts retaining the valve to the brackets.
- (6) Assemble the sealing ring (73-12-01/1-20) to the plunger assembly (73-12-01/1-10).
- (7) Install the plunger assembly to the valve and secure with the clamp ring.

7. Install Oil Feed Tubes, Oil Tank to the Main Oil Pump  
(Ref. Item 24, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.

B. Installation (Ref.Fig.506).

- (1) Install the dee-headed bolts (79-22-01/1-50) to the tube (79-22-01/1-10) rear flange and secure with retaining rings (79-22-01/1-40).
- (2) Position the gasket (79-22-01/1-60) and the tube to the oil tank mounting face, retain with the bolts (79-22-01/1-20). Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Position the gasket (79-22-01/1-70) to the rear flange of the tube over the securing bolts.
- (4) Position the gasket (79-22-01/1-120) and the tube (79-22-01/1-80) to the oil pump mounting face and the forward tube. Position the bracket (79-22-01/1-110) to the rear tubes rear flange and retain the bracket, tube flange and gasket to the oil pump mounting face with bolts (79-22-01/1-90), do not fully tighten at this stage.
- (5) Position the bracket (79-22-01/1-55) to the lower face of the tubes flange joint. Secure the bracket, tube flanges and gasket with nuts (79-22-01/1-30). Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Torque-tighten the bolts securing the rear tube to the oil pump mounting face between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Install the inlet thermometer.
  - (a) Install the engine oil inlet thermometer and gasket (79-32-01/1-10-50) into the housing in the rear oil tube (79-22-01/1-80).
  - (b) Position the bracket (79-32-01/1-40) on the thermometer flange and retain the bracket and thermometer flange to the tube mating face with bolts (79-32-01/1-30).
  - (c) Install the bolts (79-32-01/1-20) in the thermometer flange to finally secure the flange and mating face.
  - (d) Torque-tighten the bolts between 60 and 65 lbf in. (6,8 and 7,3 N.m).

OLYMPUS 593

MK.610-14-28  
OVERHAUL

8. Install Anti-drain Tube, Connection on Tube Oil Cooler to Oil Tank (Ref. Item 25, Fig.501 of Stage 1)

A. Assemble Strainer to Tube (Ref.Fig.507).

- (1) Assemble the keywasher to the strainer assembly (79-22-03/1-110-100).
- (2) Screw the strainer into the tube (79-22-03/1-80) and locate the keywasher leg in the tube flange.
- (3) Tighten the strainer and lock it with the keywasher.

B. Install Tube (Ref.Fig.507).

- (1) Apply lubricant A to the union connection and lubricant B to attachment bolts.
- (2) Position the tube on the engine with a gasket (79-22-03/1-120) located between the tube flange and connecting tube.
- (3) Engage the union connection and lightly tighten the union nut.
- (4) Retain the tube flange with bolts (79-22-03/1-120) lightly tightened.
- (5) Assemble the loop lamp (79-22-03/1-10) to the tube and secure it to the bracket with a nut, two flat washers and bolt (79-22-03/1-20-30-40) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Torque-tighten the tube flange retaining bolts to between 60 and 65 lbf in. (6,8 and 7,3 N.m).
- (7) Torque-tighten the union nut (Tools 1529 and 1648) to between 220 and 240 lbf in. (25 and 27 N.m).
- (8) Wire-lock the union nut.

9. Install Oil Scavenge Tubes, Right-Hand Gearbox to Oil Return Tube (Ref. Item 26, Fig.501 of Stage 1)

A. Install Lower Tube (Ref.Fig.508).

- (1) Apply lubricant B to attachment bolts.
- (2) Position the tube (79-22-02/2-10) on the engine with the gasket (79-22-02/2-30) located between the tube flange and the right-hand gearbox.
- (3) Retain the tube flange with five bolts (79-22-02/2-20) lightly tightened.
- (4) Assemble the loop clamp (79-22-02/2-40) to the tube and the clipnut (2-70) to the bracket (Detail A) then attach the loop clamp with a flat washer and bolt (79-22-02/2-60-50) lightly tightened.
- (5) Assemble two loop clamps (79-22-02/2-110) to the tube and attach them to the brackets (Details B and C) with nuts, flat washers and bolts (79-22-02/2-120-130-140) lightly tightened.

B. Install Upper Tube (Fig.Ref.508).

- (1) Apply lubricant A to the union connections and lubricant B to attachment bolts.
- (2) Position the tube (79-22-02/2-250) on the engine, engage the union connections and lightly tighten the union nuts.
- (3) Assemble the loop clamp (79-22-02/2-180) to the tube and attach it to the bracket (Detail E) with a nut, flat washer and a bolt (79-22-02/2-190-200-210) lightly tightened.

C. Torque-tightened Attachment Bolts and Union Nuts.

- (1) Torque-tighten the loop clamp bolts, except at Detail B, to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

NOTE: The bolt at Detail B is torque-tightened later in the procedure.

- (2) Torque-tighten the lower tube flange bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Torque-tighten the union nuts to between 310 and 340 lbf in. (35 and 38,4 N.m) then wire-lock them.

10. Install the Aircraft Fuel and Hydraulic Tanks Pressurization Tube and Electrical Harness Support Tray (Ref. Item 27, Fig.501 of Stage 1)

A. Preparation for Installation.

- (1) Apply lubricant 'A' to the tube unions and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.509).

- (1) Assemble the tube (75-05-03/1-80) to the duct at the lower rear of the HP compressor case, and lightly tighten the union nut.
- (2) Assemble the bracket (71-51-01/10-280) to the support bracket (75-01-04/1-70) on the HP compressor air cooling duct and retain with the bolts (71-51-01/10-290). Torque-tighten the bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Assemble the bottom block to the tray (71-51-01/10-90-200) and retain with bolts (71-51-01/10-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Assemble the tray to the support bracket and secure with bolts (71-51-01/10-210), torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Assemble the pillar bolt (75-05-03/1-40) to the upper face of the tray and secure with the nut (75-05-03/1-20) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Assemble the loop-clamp (75-05-03/1-10) and the half clamp shells (75-05-03/1-75) (SB.0L.594-75-8972-27 standard) to the tube and attach it to the pillar bolt with the flat washer and nut (75-05-03/1-30-20). Torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (7) Torque-tighten the tube union nut to between 280 and 310 lbf in. (31,6 and 35,0 N.m) (Tools 908 and 1648). Wire-lock the tube union.

11. Assemble the Reheat Fuel Supply Tube from First Stage Pump to the Engine (Ref. Item 28, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube unions and lubricant 'B' to the bolts.
- (2) Assemble the filter to the tube (73-13-03/1-310-320).
  - (a) Insert the filter in the tube. Ensure the filter goes fully home and the inlet hole in the filter body and the inlet tube are aligned.
  - (b) Check that when assembled, there will be a minimum clearance of 0.020 in. (0,50 mm) between the outer face of the filter and the face of the blanking plate spigot (Ref.Fig.510).
  - (c) Assemble a serviceable seal plate to the blanking plate spigot (73-13-03/1-300-290).
  - (d) Engage lug on blanking plate spigot within location slot on filter face and press plate and seal into position with attachment holes aligned.
  - (e) Position the bracket (73-13-03/1-230) on the filter body flange and retain with bolts and nuts (73-13-03/1-250-240) lightly tightened.
  - (f) Install bolt and nut (73-13-03/1-280-260) in the lower filter body flange next to the bracket.
  - (g) Install bolts and nuts (73-13-03/1-270-260) in the remaining holes of the filter, seal and blank plate flange.
  - (h) Torque-tighten all the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (j) Assemble the closure ferrule (73-13-03/1-220) to the blanking plate union. Torque-tighten union nut to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909) and wire-lock it.

B. Installation (Ref.Fig.511).

- (1) Position the seal plate (73-13-03/1-420) on the first stage pump mounting face.
- (2) Position the tube (73-13-03/1-320) to the seal plate and pump mounting face and secure with bolts (73-13-03/1-330) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the loop clamp (73-13-03/1-10) to the tube and align with the bracket (73-13-01/1-50) mounted on the HP casing stage three blow-off position. Secure the loop clamp and bracket with bolt, washers and nut (73-13-03/1-40-30-20), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Temporarily assemble the loop clamp (73-13-03/1-72) to the tube, position to the rear of the filter. Retain the clamp with the bolt, washer and nuts (75-02-09/1-220-200-190) lightly tightened.
- (5) Assemble the loop clamp (73-13-03/1-80) to the tube align with the bracket (72-33-01/6-220) mounted on the intermediate case/HP casing flange. Secure the loop clamp to the bracket with bolt, washer and nut (73-13-03/1-110-100-90), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Temporarily assemble the loop clamp (73-13-03/1-150) to the tube. Attach to the bracket (72-33-01/4-230) with the bolt, washer and nut (73-13-03/1-160-170-180) lightly tightened.

12. Install the Fuel Feed Tube, Filter to Oil Cooler (Ref. Item 29, Fig.501 of Stage 1)

A. Prepare for installation.

- (1) Apply lubricant 'A' to the blanking ferrule location threads, and lubricant 'B' to the bolt threads.

B. Installation (Ref.Fig.512).

- (1) With the seal plate between the front tube section flange (73-13-01/1-60-10) and fuel filter outlet mounting face, retain tube in position with the bolts (73-13-01/1-20) lightly tightened.
- (2) Hold rear section of tube with the seal plate (73-13-01/1-270-230) between the mating faces on the oil cooler location, position the bracket and washers (73-13-01/1-260-250) on the tube flange and retain with bolts (73-13-01/1-240) lightly tightened.
- (3) With the seal plate (73-13-01/1-60) inserted between the front and rear tube section junction flanges and the bracket (73-13-01/1-50) positioned against the forward face of the front tube section, retain with bolts and nuts (73-13-01/1-40-30), lightly tightened.
- (4) Torque-tighten the tube flange bolts at each of the three locations to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Install the loop clamps.
  - (a) Assemble the loop clamp (73-13-01/1-70) to the rear section of the tube near the gearbox.
  - (b) Assemble clipnut (73-13-01/1-90) to the bracket (72-62-01/5-50) on the left-hand gearbox oil strainer end cover.
  - (c) Secure clamp bracket with bolt, washer and clipnut (73-13-01/1-80-150-90) torque tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (d) Assemble the loop clamp (73-13-01/1-130) to the rear tube section near the HP front case.
  - (e) Align clamp with bracket (72-33-01/4-280) mounted on the HP front case lower periphery and retain clamp with bolt, washer, spacer and nut (73-13-01/1-170-150-160-140) lightly tightened. (To be secured on installation of fuel feed tube, oil cooler to second stage pump Ref. para.13).

- (6) Install the tube closure ferrules.
  - (a) Assemble the tube closure ferrules (73-13-01/1-220) to the rear tube section junction flange union and to the union in the tube elbow and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,7 N.m).
  - (b) Assemble the tube closure ferrule (73-13-01/1-210) to the two unions in the rear tube flange at the oil cooler and torque-tighten to between 220 and 240 lbf in. (24,8 and 27,1 N.m). (Tools 1752 and 1648).
  - (c) Wire-lock all the tube closure ferrules.
- (7) Secure the loop clamp (73-13-03/1-150) previously assembled (Ref. para.4.B.(9)) torque-tighten the nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) Ensure a minimum clearance of 0.100 in. (2,54 mm) between the tube joint flanges and the reheat fuel feed tube.

13. Install the Fuel Feed Tube, Oil Cooler to Second Stage Pump (Ref. Item 30, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the attachment bolts.

B. Installation (Ref.Fig.513).

- (1) Position the tube (73-13-01/2-50) to the oil cooler and the second stage fuel pump.
- (2) Secure the tube flanges.
  - (a) With a seal plate (73-13-01/2-100) inserted between the mating faces, attach the tube flange to the oil cooler mounting face with bolts (73-13-01/2-70) lightly tightened.
  - (b) With a seal plate (73-13-01/2-100) inserted between the mating faces, attach the tube flange to the pump mounting face with bolts (73-13-01/2-60) lightly tightened.

OVERHAUL

(c) Torque-tighten the bolts at both flanges to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(3) Assemble the loop clamp (73-13-01/2-10) to the tube and secure it to the bracket (72-33-01/4-280) mounted on the HP case lower periphery, using the existing loosely assembled bolt, spacer, washer and nut (Ref. Para.12.B.(5)) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

14. Install the HP Turbine Bearing Oil Feed Tube (Ref. Item 31 Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Ensure the thermometer is thoroughly clean and undamaged.
- (2) Apply lubricant 'A' to the tube unions and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.514).

- (1) Install the elbow.
  - (a) Position the gasket, elbow and bracket (72-01-03/5-290-280-270) to the mounting face on the left-hand gearbox.
  - (b) Retain the bracket, elbow and gasket to the gearbox with bolts (72-01-03/5-250) each side of the threaded union and bolts (72-01-03/5-260) in the other positions.
  - (c) Torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the tube (72-01-03/5-230) to the elbow and the union on the delivery casing and lightly tighten the union nuts.

OVERHAUL

- (3) Assemble the loop clamp (72-01-03/5-10) to the tube and secure to the bracket (72-33-01/6-300) on the intermediate case HP case flange, using the existing bolt, distance piece, washers and nut (72-01-03/5-50-40-30-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (4) Assemble the loop clamp (72-01-03/5-90) to the tube and secure to the bracket (72-33-01/4-230) on the HP case lower periphery, using the existing bolt, washer and nut (72-01-03/5-120-110-100) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (5) Assemble the loop clamp (72-01-03/5-160) to the tube and secure to the bracket (72-33-01/8-320) on the HP case/delivery casing flange, secure with the bolt, washer and nut (72-01-03/5-190-180-170) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (6) Torque-tighten the tube union nut to the delivery case to between 280 and 310 lbf in. (31,6 and 35,0 N.m) and the tube union nut to the gearbox elbow to between 310 and 340 lbf in. (35,0 and 38,4 N.m). (Tools 1565, 1528, 322, 947 and 1648). Wire-lock the tube unions.
  - (7) Assemble the gasket and thermometer (77-23-02/1-30-10) to the tube and secure with the bolts (77-23-02/1-20) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Wire-lock the bolts.
15. Install the LP Turbine Bearing Oil Feed Tube (Ref. Item 32, Fig.501 of Stage 1)
- A. Prepare for Installation.
    - (1) Apply lubricant 'A' to the tube unions and lubricant 'C' to all the bolts unless stated otherwise.
  - B. Installation (Ref.Fig.515).
    - (1) Position the tube (72-01-03/4-330) along the bottom of the engine, and hand tighten the front union nut to the HP turbine bearing oil tube (72-01-03/5-230).

- (2) Assemble the loop clamps to the tube and attach as follows:
- (a) Attach the loop clamp (72-01-03/4-80) to the bracket (75-03-01/3-230) mounted on the air elbow flange secured to the fuel heater control valve with the pillar bolt, washer and nut (75-03-02/1-270-260-250), lightly tightened.
  - (b) Attach the loop clamp (72-01-03/4-260) together with the loop clamp (75-02-11/1-60), to the bracket (72-42-01/4-280) mounted on the front CCOC flange with bolt, washers and nut (72-01-03/4-290-280-270) lightly tightened with lubricant 'B' applied.
  - (c) Loosely assemble the loop clamp (72-01-03/4-120) to the tube, align with the rear of the drains tank and retain with the pillar bolt, washer and nut (72-01-03/4-150-140-130). Assemble a nut (4-130) to the free end of the pillar bolt and lightly tighten the nuts on the bolt with lubricant 'B' applied.
- (3) Position the rear tube (72-01-03/4-70) to the tube (72-10-03/4-80) and the union on the exhaust diffuser and hand tighten the unions.
- (4) Assemble the loop clamp (72-01-03/4-10) to the tube and attach to the bracket (72-53-00/7-250) mounted on the CCOC/exhaust diffuser case using the pillar bolt, distance piece and nut (75-03-02/1-200-195-190). Lightly tighten the nut.
- (5) Torque-tighten the tube union nut to HP turbine bearing and the tube union to between 280 and 310 lbf in. (31,6 and 35,0 N.m).
- (6) Torque-tighten the tube union nut to exhaust diffuser to between 490 and 550 lbf in. (55,4 and 61,0 N.m). (Tools 1648, 1526, 908 and 946).
- (7) Wire-lock all the tubes unions and nuts.

16. Install the LP and HP Turbine Bearings Cold Vent Tubes and Connector Assembly (Ref. Item 33, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Before commencing installation ensure that the rear tube to be installed and the mating tube in the No.5 vane of the turbine exhaust diffuser (Ref.72-53-00 Sub-assembly) are to the same service bulletin standard.
- (2) Apply lubricant 'C' to the union threads and to the nuts and bolts (72-53-00/1-380-400) securing the tube flange (75-02-03/1-240). Apply lubricant 'B' to the remaining bolts.

B. Installation (Ref.Fig.516).

- (1) Assemble the connector and the bracket (75-02-03/1-100-90) to the right-hand support tube (72-42-01/1-270), and retain with bolts (75-02-03/1-80) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the tube (75-02-03/1-120) between the connector and the delivery case connection, hand tighten the union nuts.
- (3) Assemble the loop clamp (75-02-03/1-10) to the tube and attach to the bracket (72-42-01/3-500) mounted on the delivery case/CC0C flange with the bracket with bolt, washer and nut (75-02-03/1-40-30-20), lightly tightened.
- (4) Torque-tighten the tube union nut/delivery case connection between 310 and 340 lbf in. (35,0 and 38,4 N.m). Torque-tighten the tube union nut on the multiple connector between 280 and 310 lbf in. (31,6 and 35,0 N.m). (Tools 1648, 1565, 322 and 908). Wire-lock the tube unions.
- (5) Install the closure ferrule, comprising of ferrule, union nut, washer and retaining ring (75-02-03/1-230-220-210-200), to the tube union. Torque-tighten the union nut to between 220 and 240 lbf in. (24,8 and 27,1 N.m) and wire-lock it.
- (6) Assemble the tube (75-02-03/1-235) to the rear union on the connector and hand tighten.

OVERHAUL

- (7) Assemble the loop clamp (75-02-03/1-130) to the tube and secure it to the bracket (72-53-00/6-270) mounted on the CC0C/exhaust diffuser flanges with bolt, washer and nut (72-02-03/160-150-140) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Assemble the tube (75-02-03/1-240).
  - (a) Remove the loosely assembled nuts (72-53-00/1-380) from the tube mounting face on the exhaust diffuser, and apply lubricant 'C' to the threads.
  - (b) Assemble the sealing plate and gasket (75-02-03/1-250-260) to the tube flange and locate on the mounting face on the exhaust diffuser. Retain with the nuts lightly tightened.
  - (c) Engage the tube union with the rear union of the installed tube mounted to the rear connector union and hand tighten the union nut.
  - (d) Ensure that the locking (run-down) torque is not less than 3.5 lbf in. (0,4 N.m), and torque-tighten the tube flange nuts to 100 lbf in. (11,5 N.m).
- (9) Assemble the closure ferrule, comprising ferrule, union nut, washer and retaining ring (75-02-03/1-230-220-210-200), to the tube union at the rear of the connector. Torque-tighten the union nut to between 220 and 240 lbf in. (24,8 and 27,1 N.m).
- (10) Torque-tighten the tube union nuts between 280 and 310 lbf in. (31,6 and 35,0 N.m).
- (11) Ensure a minimum clearance of 0.050 in. (1,25 mm) between the tube (75-02-03/1-120) forward of the connector and the lug on the right-hand support tube.
- (12) Wire-lock the closure ferrule and tube union nuts.

## 17. Install the Starter Pump (Ref. Item 34, Fig.501 of Stage 1)

### A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.
- (2) Record the type and serial number of the starter pump on the accessory sheet.

ASSEMBLY

OVERHAUL

B. Installation (Ref.Fig.517).

- (1) Assemble the pump (73-11-03/1-10) between the mounting brackets (72-33-01/5-90, 360) mounted on the HP compressor case.
- (2) Retain the pump to the front bracket with the bolt, washer and nut (73-11-03/1-40-30-20). Lightly tighten the bolt and nut.
- (3) Retain the pump to the rear bracket with the flanged pins and bolts (73-11-03/1-60-50). Lightly tighten the bolts.
- (4) Torque-tighten all the bolts to between 170 and 190 lbf in. (19,2 and 21,5 N.m).

18. Assemble the Connector and Servo Return Tube to the Reheat Fuel Controller (Ref. Item 35, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.518).

- (1) Assemble the connector block (73-13-08/1-130) to the reheat fuel controller unit (73-23-01/1-10) and retain it with a bolt, pillar bolt and nut (73-13-08/1-110, 120, 100) as shown.
- (2) Torque-tighten the bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Install the ferrule-assembly (73-13-08/1-90) on the connector block at the position shown.
- (4) Position the tube (73-13-08/1-80) on the reheat fuel controller, engage the union connections and lightly tighten the union nuts.
- (5) Assemble the clipnut (73-13-08/1-40) to the bracket (73-23-01/1-10) attached to the reheat fuel controller.

- (6) Assemble the loop clamp (73-13-08/1-10) to the tube and secure it to the bracket with the bolt and washer (73-13-08/1-20, 30) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Torque-tighten union nuts as follows:
  - (a) Tube union nut at the reheat fuel controller to between 220 and 240 lbf in. (24,8 and 27,1 N.m).
  - (b) Tube union nut at the connector block to between 190 and 210 lbf in. (21,5 and 23,7 N.m).
  - (c) Closure ferrule to between 190 and 210 lbf in. (21,5 and 23,7 N.m). Use Tools 909, 1752 and 1648.
  - (d) Wire-lock the union nuts of the tube and closure ferrule.

19. Install the Reheat Fuel Controller/Distribution and Dump Valve (Ref. Item 36, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.
- (2) Record the type and serial numbers of the reheat fuel controller and the distribution and dump valve assembly on the accessory sheet.

B. Installation (Ref.Fig.519).

- (1) Support the assembly in position, with the reheat fuel controller mounting face against the mounting plate (72-33-01/8-30) and the support cone aligned with the bracket (72-33-01/4-280) at the lower left-hand side of the HP compressor case.
- (2) Assemble two flanged pins (73-23-01/1-50) to the mounting plate and engage them in the reheat fuel controller mounting face.
- (3) Insert bolts (73-23-01/1-40) through the flanged pins and lightly tighten.

- (4) Retain the support cone to the bracket with a bolt, flat washer, distance piece and nut (73-23-01/1-140, 130, 120, 110). Lightly tighten the nut and bolt.
- (5) Torque-tighten all bolts to between 170 and 190 lbf in. (19,2 and 21,5 N.m). Locking (run-down) torque 6.5 lbf in. (0,73 N.m).
- (6) SB.0L.593-71-8988-32. Assemble the loop clamp (27G) (71-51-01/6-150) to the reheat FCU flylead and secure to the bracket on the reheat flowmeter with the bolt, spacer and nut (71-51-01/6-170-190-180), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

20. Install the Fuel Tubes, Starter Pump to FCU (Ref. Item 37, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to tube union connections and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.520).

- (1) Install the housing (73-13-05/1-110).
  - (a) On engines to pre S.B.73-8311-62 standard, insert filter with interposed seal plate (73-13-05/1-120-130) into housing. Locate the assembly on the FCU location with a second seal plate between the mating faces and retain with three bolts (73-13-05/1-100A) lightly tightened.
  - (b) On engines to S.B.73-8311-62 standard, locate housing on the FCU location with the seal plate (73-13-05/1-120) between the mating faces and retain with three bolts (73-13-05/1-100B) lightly tightened.
  - (c) Torque-tighten bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the tube (73-13-05/1-90) to the filter housing union, finger-tighten the union nut.
- (3) Position the tube (73-13-05/1-80) to the engine, engage the union nuts to the starter pump and to the tube fitted to the filter housing and hand tighten the union nuts.

- (4) Install the loop clamps (73-13-05/1-10).
  - (a) Assemble a loop clamp to the tube (73-13-05/1-80) and attach it to the bracket (72-33-01/4-110) mounted on the HP compressor case with bolt, washer and nut (73-13-05/1-20-30-40) lightly tightened.
  - (b) Assemble a loop clamp to the tube and attach it to the bracket (72-33-01/4-190) mounted on the HP compressor case with bolt, washer and nut (73-13-05/1-20-30-40) lightly tightened.
  - (c) Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (5) Torque-tighten the tube union nuts between 280 and 310 lbf in. (31,6 and 35,0 N.m) (Tool 908) and wire-lock them.

21. Install the Oil Tank Overboard Rear Vent Tube and Support Bracket (Ref. Item 38, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union connections and lubricant 'B' to the bolts except where stated.

B. Installation.

- (1) Assemble the pillar bolts, washers and nuts (73-23-01/1-100-90-80) to the reheat controller support cone. Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the bracket (75-02-02/1-70) to the pillar bolts and secure with washers and nuts (73-23-01/1-90-80) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Secure the bracket to the distribution block front mounting bracket with bolts and nuts (75-02-02/1-60-50) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (3) Apply lubricant 'A' to the bolts (75-02-02/1-20) (Ref. SB.72-115 Part 4). Position the seal plate to the tube (75-02-02/1-80-90) and secure with bolts and nuts (75-02-02/-20-10), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Ensure the bolts do not protrude below the sealing face of the plate.
- (4) Install tube (75-02-02/1-90) and seal plate.
  - (a) Apply lubricant 'A' to the bolts (75-02-02/1-40-110).
  - (b) Attach the tube and seal plate to the bracket with bolt and nut (75-02-02/1-30) hand tightened.
  - (c) Assemble a gasket between the tube flanges (75-02-02/1-120-90-270) and position the bracket (75-02-02/1-115) to the flange of the upper tube.
  - (d) Secure the bracket, tube flanges and gasket with the bolts and nuts (75-02-02/1-110-100) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (e) Torque-tighten the nut and bolt, securing the tube to the bracket to between 135 and 145 lbf in. (15,3 and 16,4 N.m). Locking (run-down) torque 6.5 lbf in. (0,73 N.m).

22. Install the Fuel Tube, Second Stage Pump to Starter Pump  
(Ref. Item 39, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union connections and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.522)

- (1) Position the tube (73-13-04/1-50) between the starter pump and oil cooler to second stage pump fuel tube unions. Engage and hand tighten the union nuts.

- (2) Assemble the loop clamp (73-13-04/1-10) to the tube and attach it to the bracket (72-33-01/4-230) supporting the reheat feed tube to the HP case stage three blow-off position, using the nut and bolt (74-21-01/2-50-40) lightly tightened.
- (3) Torque-tighten the tube union nuts to between 310 and 340 lbf in. (35,0 and 38,4 N.m) (Tools 1648, 322 and 1565).
- (4) Wire-lock the tube union nuts.

23. Complete the Installation of the Main Fuel Tubes, Manifold to Distribution and Dump Valve (Ref. Item 40, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union connections and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.523).

- (1) Secure the fuel inlet manifold feed tubes flanges to the distribution and dump valve.
  - (a) Insert a seal plate (73-13-02/2-180) between the upper fuel feed tube flange (73-13-02/2-160) and the distribution and dump valve mounting.
  - (b) Secure the tube flange and seal plate to the distribution and dump valve with bolts (73-13-02/2-170) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Insert a seal plate (73-13-02/2-290) between the lower fuel feed tube flange (73-13-02/2-270) and the distributor mounting block.
  - (d) Secure the tube flange and seal plate to the distribution and dump valve with bolts (73-13-02/2-280) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (2) Torque-tighten the tube union nuts to the manifolds between 400 and 440 lbf in. (45,2 and 49,7 N.m) (Tools 1528, 947 and 1648).
- (3) Install closure ferrules (73-13-02/2-150-260) to the upper and lower tubes and torque-tighten to between 50 and 55 lbf in. (5,6 and 6,2 N.m) (Tools 1529, 948 and 1656).
- (4) Wire-lock the union nuts of the tube and closure ferrules.

24. Assemble the Reheat Flowmeter to the Reheat Supply Tube and Reheat Fuel Controller (Ref. Item 41, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.
- (2) Record the type and serial number of the reheat flowmeter on the accessory sheet.

B. Installation (Ref.Fig.524).

- (1) Connect flowmeter to fuel tube.
  - (a) Position flowmeter (73-33-02/1-10) on engine and carefully insert serviceable seal plate (73-13-03/1-430), ensuring that the flat of the plate is against the electrical connection position and bolt-holes are aligned. If necessary, turn seal plate to reverse faces and align bolt-holes.
  - (b) Assemble the two short bolts (73-13-03/1-340) at the threaded hole locations and lightly tighten.
  - (c) Position nut plate assembly (73-13-03/1-370) against flowmeter flange and secure at plain hole position with nut and bolt (73-13-03/1-350, 360) lightly tightened.
  - (d) Assemble three bolts (73-13-03/1-360) through fuel tube and flowmeter flanges to engage with the three nuts of the nut plate assembly. Lightly tighten bolts.

- (2) Connect flowmeter to reheat fuel controller elbow.
  - (a) Carefully insert serviceable seal plate (73-33-02/1-100) between flowmeter flange and reheat fuel controller elbow.
  - (b) Install and lightly tighten the six bolts, washers and nuts (73-33-02/1-20, 30, 40, 15) securing the flanges, positioning the two smaller diameter washers under heads of bolts at each side of the protrusion on the flange, as indicated in Figure 524.
- (3) Torque-tighten nuts and bolts at both flanges to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

25. Install Fuel Tubes, Starter Pump to Distribution and Dump Valve (Ref. Item 42, Fig.501 of Stage 1)

A. Install Tube, Starter Pump to Union Connection (Ref. Fig.525).

- (1) Apply lubricant A to tube union connections and lubricant B to attachment bolts and nuts.
- (2) Assemble the clipnut (73-13-06/1-40) to the bracket (72-33-01/4-190) mounted on the HP compressor case (Detail C).
- (3) Assemble the clipnut (73-13-06/1-40) to the bracket (75-01-04/1-50) mounted on the cooling air duct (Detail D).
- (4) Assemble two loop clamps (73-13-06/1-10) to the tube (73-13-06/1-80) and while supporting the tube in position, engage the union connection at the starter pump and lightly tighten the union nut.
- (5) Attach the loop clamps to the support brackets with bolts and washers (73-13-06/1-20, 30) and clipnuts. Lightly tighten the bolts.

B. Install Tube, Union Connection to Distribution and Dump Valve (Ref.Fig.525).

- (1) Apply lubricant A to the union connection. Apply lubricant B to tube flange attachment bolts and loop clamp attachment nuts and bolts.
- (2) Support the tube (73-13-06/1-160) on the engine, engage the union connection and lightly tighten the union nut.
- (3) Insert a seal plate (73-13-06/1-180) between the tube flange and the mounting face on the distribution and dump valve. Retain with bolts (73-13-06/1-170) lightly tightened.
- (4) Assemble the loop clamp (73-13-06/1-90) to the tube and attach it to the support bracket with a bolt, flatwasher and nut (73-13-06/1-120, 110, 100) lightly tightened.

C. Torque-tighten Attachment Bolts and Union Nuts.

- (1) Torque-tighten loop clamp attachment bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Torque-tighten tube flange attachment bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Torque-tighten tube union nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m) with the torque setting adapter (Tool 909). Wire-lock both union nuts.

26. Install Fuel Tubes, Distribution and Dump Valve to Pilot Nozzles  
(Ref. Item 43, Fig.501 of Stage 1)

A. Install Tube, Distribution and Dump Valve to Tube Adapter (Ref.Fig.526).

- (1) Apply lubricant A to tube union connections and lubricant B to attachment bolts.
- (2) Position the tube (73-13-06/2-150) on the engine with a seal plate (73-13-06/2-210) located between the tube flange and dump valve.

- (3) Position the bracket (73-13-06/2-200) on the tube flange and retain the assembly with bolts (73-13-06/2-170) at the bracket locations and bolts (73-13-06/2-160) at the remaining locations. Lightly tighten the bolts.
  - (4) Retain the tube adapter to the bracket mounted on the HP compressor diffuser case with two bolts and nuts (73-13-06/2-190-180) lightly tightened.
  - (5) Assemble the clipnut (73-13-06/2-110) to the bracket shown at detail C.
  - (6) Assemble two loop clamps (73-13-06/2-10-80) to the tube and align them with the mounting brackets.
  - (7) Retain the loop clamp to the bracket (detail C) with a flat washer and bolt (73-13-06/2-100-90) and the clipnut.
  - (8) Retain the loop clamp (Detail B) with a bolt, flat washer and nut (73-13-06/2-40-30-20).
- B. Install Tube, Adapter to Right-hand Pilot Nozzle (Ref.Fig.526).
- (1) Apply lubricant A to tube union connections and lubricant B to loop clamp attachment bolts.
  - (2) Position the tube (73-13-06/2-370) on the engine, engage the union connections at the pilot nozzle and adapter then lightly tighten the union nuts.
  - (3) Assemble two loop clamps (73-13-06/2-300) to the tube and attach them to the support brackets (Details F and G) with bolts, flat washers and nuts (73-13-06/2-330-320-310).
- C. Install Tube, Adapter to Left-hand Pilot Nozzle (Ref.Fig.526).
- (1) Apply lubricant A to union connections and lubricant B to loop clamp attachment bolt.
  - (2) Position the tube (73-13-06/2-290) on the engine, engage the union connections at the pilot nozzle and adapter then lightly tighten the union nuts.

- (3) Assemble the loop clamp (73-13-06/2-220) to the tube and retain it to the bracket (Detail E) with a bolt, washer and nut (73-13-06/2-250-240-230) lightly tightened.

NOTE: Ensure that a minimum clearance of 0.150 in. (3,81 mm) exists between the tube and the electrical harness bracket.

D. Torque-tighten Attachment Bolts and Union Nuts.

- (1) Torque-tighten all loop clamp retaining bolts and nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Torque-tighten tube flange retaining bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Torque-tighten the union nuts at the pilot nozzles and tube adapter to between 190 and 210 lbf in. (21,5 and 23,7 N.m).
- (4) Wire-lock the union nuts.

27. Install Fuel System Air Bleed Tubes (Ref. Item 44, Fig.501 of Stage 1)

A. Install Tube, Oil Cooler to Union Connection (Ref.Fig.527).

- (1) Apply lubricant A to the union connections and lubricant B to loop clamp attachment bolts.
- (2) Position the tube (73-13-12/1-180) on the engine, engage the union connection at the oil cooler and lightly tighten the union nut.
- (3) Assemble the loop clamp (73-13-12/1-110) to the tube and attach it to the support bracket with a bolt, flat washer and nut (73-13-12/1-140-130-120) lightly tightened.

B. Install Tube and Bleed Valve (Ref.Fig.527).

- (1) Apply lubricant A to the union connection and valve assembly. Apply lubricant B to attachment bolts.

- (2) Assemble bleed valve to tube.
  - (a) Screw the valve assembly into the tube (73-13-12/1-60-70) and lightly tighten.
  - (b) Assemble the seal and capnut (73-13-12/1-50-40) to the tube. Tighten the capnut and wire-lock it.
  - (c) Attach the chain to the anchor ring (73-13-12/1-20-30) with the key ring (73-13-12/1-10) then assemble the anchor ring to the capnut.
- (3) Position the tube on the engine, engage the union connection and lightly tighten the union nut.
- (4) Retain the tube attachment lug to the bracket mounted on the primary nozzle fuel tube flange, with bolts and nuts (73-13-12/1-90-80) lightly tightened.
- (5) Attach the chain to the bracket with the key ring.

C. Torque-tighten Attachment Bolts and Union Nuts.

- (1) Torque-tighten the loop clamp attachment bolt and the tube lug attachment bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Torque-tighten the union nuts to between 190 and 210 lbf in. (21,5 and 23,5 N.m) with the torque setting adapter (Tool 909).
- (3) Wire-lock the union nuts.

TUBES AND ACCESSORIES - ASSEMBLY

1. Install LP Shaft Signal System Cylinder/Piston Unit Complete with Front and Centre Cables (Item 45, Fig.501 of Stage 1)

A. Prepare for Installation.

(1) Apply:

- (a) Lubricant 'B' to all bolts unless stated otherwise.
- (b) Jointing compound 'A' to the bracket (76-21-01/2-110) and cover (76-21-01/2-80).
- (c) Lubricant 'T' to S.B.76-8570-26 standard centre cable (76-21-01/2-380) allow to soak, then drip dry.
- (d) Lubricant 'G' to S.B.76-8570-26 standard centre cable (76-21-01/2-380A) during installation (Ref.para.C.(2)).

WARNING: WASH HANDS AFTER CONTACT WITH LUBRICANT 'G' ON SIGNAL SYSTEM COMPONENTS. LUBRICANT CONTAINS COPPER AND LEAD AND IS TOXIC.

B. Install Support Brackets and Cylinder/Piston Unit (Ref.Fig.501).

- (1) Assemble the support bracket (76-21-01/2-110) to the lower left-hand intrascope position on the CCOC and retain with the screws (76-21-01/2-100), tighten the screws. Ensure the heads of the screws are below the surface of the bracket.
- (2) Assemble the cover (76-21-01/2-80) to the bracket and retain with bolts (76-21-01/2-70) with lubricant 'C' applied. Torque-tighten the bolts to 100 lbf in. (11,5 N.m) then wire-lock them.
- (3) Install cylinder/piston unit.
  - (a) Position the block (76-21-01/2A-85) to the rear face of the bracket lug (Ref. SB.76-14).

SNECMA

- (b) Position the cover (76-21-01/2B-390) to the forward face of the bracket lug.
- (c) Position the cylinder/piston unit fixed guard to the cover.
- (d) Retain the block, cover and cylinder/piston unit fixed guard to the bracket with bolts (76-21-01/2A-90). Torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (e) Secure the cylinder/piston unit base plate (76-21-01/1-110) to the HP compressor diffuser case/CC0C flange using the existing bolts and nuts. Torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (4) Secure the bracket (75-03-01/3-390) to the block (76-21-01/2A-85) using bolts and nuts (75-03-01/3-380-370). Torque-tighten the bolts and the loop clamps bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Slacken off the bolts securing the distribution and dump valve shroud, then turn the shroud to align withdrawal slots.
- (6) Prevent the reset plunger from falling, trip the mechanism with a hooked tool and detach the reset plunger. Do not fully withdraw the plunger mechanism on engines to pre.S.B.73-66 standard.
- (7) Engage the front cable end with the slot in the emergency dump valve secondary plunger.
- (8) Insert the 're-set' plunger to retain the front cable assembly.
- (9) Use the re-setting tool (Tool 1298) and press the re-set plunger to return the emergency dump valve to the normal position, red indicator mark below the face.

SNECMA

- (10) Insert the rigging pin (Tool 1990) and check that the holes in the shroud and plungers are in line. Pin must press fully home so that axial movement of its sleeve is taken up.

NOTE: If the pin does not pass through the pull off plunger alignment hole, the plunger may have been pressed in slightly more than the normal set position. Light rearward pressure on the reset plunger may be necessary.

- (11) Turn the shroud to retain the plunger. Torque-tighten the bolts securing the shroud to the dump valve to 40 lbf in. (4,5 N.m.).
- (12) Pull the cable shield unit forward to locate in the dump valve and retain the shield front flange with the nuts and bolts, supplied with the valve. The locking torque is between 2 and 17 lbf in. (0,2 and 1,8 N.m) for the nuts. Torque-tighten the nuts and bolts to 40 lbf in. (4,5 N.m).

NOTE: Ensure the cocking lever has freedom of movement.

- (13) Assemble the retaining ring to the groove in the adapter (76-21-01/1-40-80). Assemble the loop clamp (76-21-01/1-20) to the shield tube (76-21-01/1-90) in front of the retaining ring, secure the loop clamp with bolt and nut (76-21-01/1-30-10) and torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).

C. Install Blocks and Conduits.

- (1) On engines to S.B.76-26 standard install blocks and front and centre conduits (Ref.Fig.503).
  - (a) Prior to commencing the installation procedure, check alignment of cable end fittings and ensure that any misalignment will not cause the cables to twist when finally connected.
  - (b) Avoid kinking of cables during the installation procedure.
  - (c) Apply lubricant 'G' liberally by brush to the length of cable where it is in contact with the front block.
  - (d) Compress the front conduit and assemble it to the front block (76-21-01/2-400-410).
  - (e) Locate the centre cable in the conduit and block, compress the conduit then engage it with the cover. Position the block on the support bracket and retain it with bolts and nuts (76-21-01/2-130-120) with lubricant 'A' applied. Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
  - (f) Assemble the centre conduit (76-21-01/2-450) over the centre cable then engage the conduit end in the centre block.

# OLYMPUS 593

OVERHAUL

- (g) Assemble the rear block (76-21-01/1-510) to the centre conduit, position the rear block on the mounting bracket and retain it with nuts and bolts (76-21-01/2-490-500) with lubricant 'A' applied. Torque-tighten the nuts to 100 lbf in. (11,5 N.m).
- (h) Apply lubricant 'G' liberally by brush to the length of rear cable where it is in contact with the rear block and guide bush.
- (j) Turn the conduits to bring the slots out of alignment with those in the blocks.
- (k) Assemble guard plates to blocks.
  - (i) Assemble guard plate (76-21-01/2-440) to the front block and retain with nut and bolt (76-21-01/2-420-430) with lubricant 'A' applied.
  - (ii) Assemble guard (76-21-02/2-480) to the centre block and retain with nut and bolt (76-21-02/2-460-470) with lubricant 'A' applied.
  - (iii) Torque-tighten nuts to 100 lbf in. (11,5 N.m).
- (2) Connect the centre cable (76-21-01/2-380) to the rear cable (76-21-02/1-150) from the exhaust diffuser with the pin, washer and split cotter pin (76-21-01/2-370-360-350), bend the cotter pin to lock.

2. Install the Reheat Fuel Controller Servo Supply Tubes  
(Item 46, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.504).

- (1) Assemble the tube (73-13-13/1-150) to the fuel heater filter tube, lightly tighten the union nut.
- (2) Assemble three loop clamps (73-13-13/1-110-40) to the tube, align with:
  - (a) The bracket (72-33-01/6-300) mounted on HP compressor case front flange, retain with the existing nut, washer, distance piece and bolt, lightly tightened.
  - (b) The bracket (72-01-03/5-270) mounted on the oil feed elbow on the left-hand gearbox, retain with the nut, washers and bolt (73-13-08/1-310-320-330) lightly tightened.
  - (c) The bracket (72-31-01/6-380) mounted on the LP case rear flange. Secure the loop clamp to the bracket with the bolt, washer and nut (73-13-13/1-50-60-70) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,2 N.m).
- (3) Position the tube (73-13-13/1-270) from the front tube rear union to the reheat controller, hand tighten the union nuts at this stage.
- (4) Assemble a loop clamp (73-13-13/1-160) to the tube and bracket (72-33-01/4-150) mounted at the HP case third stage blow-off position. Secure the clamp to the bracket with bolt, washer and nut (73-13-13/1-190-180-170) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,2 N.m).

OVERHAUL

- (5) Assemble a loop clamp (73-13-13/1-230) to the tube and bracket (75-01-04/1-50) mounted at the HP case stage five blow-off position. Secure the loop clamp with the existing bolt and washer torque-tightened to between 85 and 95 lbf in. (9,6 and 10,2 N.m).
- (6) Torque-tighten the tube unions to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909) and wire-lock the union nuts.
- (7) Ensure that a clearance of 0.150 in. (2,625 mm) exists between the rear tube (73-13-13/1-270) and the CSD to cooler oil tube.

3. Install the Reheat Purge Valve Solenoid and Air Tubes  
(Item 47, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolt threads unless stated otherwise.
- (2) Record the type and serial number of the valve solenoid on the accessory sheet.

B. Installation (Ref.Fig.505).

- (1) Secure the solenoid valve to the bracket (72-33-01/7-110) on the HP case and delivery case flanges with bolts and nuts (73-24-01/1-30-20). Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Position the tube (75-03-02/2-280) between the delivery case air duct and the purge valve solenoid connection, hand tighten the unions.
- (3) Assemble the loop clamp (75-03-02/2-210) to the tube and bracket (72-42-01/3-230) mounted on the delivery case/CCOC case flange. Retain with bolt, washers and nut (75-03-02/2-240-230-220) with lubricant 'C' applied and lightly tighten.
- (4) Torque-tighten the tube unions:
  - (a) To the air duct to between 250 and 280 lbf in. (28,2 and 32,0 N.m).

OVERHAUL

(b) To the solenoid to between 140 and 160 lbf in.  
(15,8 and 18,1 N.m) (Tools 1648, 1754 and 1755).

(c) Wire-lock the tube union nuts.

(5) Position the tube (75-03-02/2-180) to the reheat  
purge solenoid valve across the bottom of the engine,  
secure the tube union nut to the valve hand tight.

(6) Assemble the loop clamp (75-03-02/2-110) to the tube  
and assemble a clipnut (75-03-02/2-140) to the  
bracket (72-34-00/3-85) mounted on the delivery case  
blank cover. Secure the loop clamp to the bracket  
with bolt and washer (75-03-02/2-120-130) with  
lubricant 'C' applied. Torque-tighten bolt to  
100 lbf in. (11,5 N.m).

(7) Position the tube (75-03-02/2-80) between the purge  
valve and the tube (75-03-02/2-180), hand tighten the  
tube unions.

(8) Torque-tighten the tube unions:

(a) To the purge solenoid valve and purge valve to  
between 190 and 210 lbf in. (21,5 and 23,7 N.m).

(b) To each other to between 280 and 310 lbf in.  
(31,6 and 35,0 N.m) (Tools 1648, 909 and 908).

(c) Wire-lock the tube union nuts.

(9) Ensure that a clearance of 0.100 in. (2,5 mm) exists  
between the tube (75-03-02/2-180) and the HP turbine  
bearing feed tube.

4. Install the Reheat Purge Air Tubes, Purge Valve to the Exhaust  
Diffuser (Item 48, Fig.501 of Stage 1)

A. Prepare for Installation.

(1) Apply lubricant 'A' to the tube unions and lubricant  
'C' to the bolts.

B. Installation (Ref.Fig.506).

- (1) Position the tube front section (75-03-02/1-420) on the engine and connect the tube front union nut to the valve hand tight.
- (2) Assemble three loop clamps (75-03-02/1-350-240-180) and the half clamp shells (75-03-02/1-235/305/415) (SB.0L.593-75-8972-27 standard) to the tube and secure in the following positions:
  - (a) Secure the clamp to the bracket (72-42-01/4-280) mounted on the delivery case CCOC flange with bolt, washer and nut (75-03-02/1-380-370-360) torque-tightened to 100 lbf in. (11,5 N.m).
  - (b) Secure the clamp to the bracket (75-03-01/3-230) mounted on the fuel heater air elbow flange using the pillar bolt, washer and nut (75-03-02/1-270-260-250) lightly tightened.
  - (c) Secure the clamp to the bracket (72-53-00/7-250) mounted on the CCOC/exhaust diffuser flange with the existing pillar bolt, distance piece and nut (75-03-02/1-200-195-190) lightly tightened.
- (3) Position the tube (75-03-02/1-150) between the front tube and the connector, hand tighten the union nuts.
- (4) Assemble two loop clamps (75-03-02/1-80-10) and the half clamp shells (75-03-02/1-75) (SB.0L.593-75-8972-27 standard) to the rear tube and secure to the brackets:
  - (a) Secure the clamp to the bracket (72-53-00/2-115) mounted on the vent elbow on the exhaust diffuser with the bolt, washer and nut (75-03-02/1-110-100-90) torque-tightened to 100 lbf in. (11,5 N.m).
  - (b) Secure the clamp to the bracket (72-54-01/4-90), mounted on the exhaust diffuser/adaptor flange with the bolt, washer and nut (75-03-02/1-40-30-20) torque-tightened to 100 lbf in. (11,5 N.m).

STAGE 4

Page 515

Dec 31/01

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

(5) Torque-tighten:

- (a) The union nuts at the valve and exhaust diffuser to between 140 and 160 lbf in. (15,8 and 18,1 N.m).
- (b) The tubes union to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tools 1754 and 1755).
- (c) Wire-lock the tube union nuts.

5. Install the Fuel Tube, FCU to the Distribution and Dump Valve (Item 49, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.507).

- (1) Position the tube (73-13-10/1-20) between the control unit and the manifold dump valve.
- (2) Insert the seal plate (73-13-10/1-40) between the tube flange and the control unit mating face. Retain the tube and seal plate to the control unit with bolts (73-13-10/1-30) lightly tightened.
- (3) Insert the seal plate (73-13-10/1-50) between the tube flange and the manifold dump valve mating face. Retain the tube and seal plate to the valve with bolts (73-13-10/1-30) lightly tightened.
- (4) Torque-tighten the tube flange bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Install the blanking ferrule (73-13-10/1-10) on the tube and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909). Wire-lock the ferrule.

6. Install the Fuel Tubes, FCU to Distribution and Dump Valve Rear Face (Item 50, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.507).

- (1) Position the tube (73-13-10/1-100) flange and the seal plate (73-13-10/1-130) on the FCU face. Secure the tube and seal plate to the FCU with bolts (73-13-10/1-110-120), the single bolt (73-13-10/1-110) being positioned in the flange nearest to the tube. Torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Assemble the loop clamp (73-13-10/1-60) to the tube and oil tank vent tube support bracket (79-21-01/1-220) on the cooler lower flange. Secure the loop clamp to the bracket with the existing bolt, washer and nut, torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Position the tube (73-13-10/1-180) to the front tube (73-13-10/1-100) hand tighten the tube union nut.
- (4) Insert a seal plate (73-13-10/1-200) between the tube flange and the distribution and dump valve rear face, emergency dump valve mounting face. Secure the tube and seal with bolts (73-13-10/1-190) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Assemble the loop clamp (73-13-10/1-210) to the tube and bracket (72-33-01/7-200) on the HP case front/rear joint flange. Secure the clamp to the bracket with bolt, washer and clip nut (73-13-10/1-220-230-240) lightly tighten only at this stage.

- (6) Torque-tighten and wire-lock the tubes union nut to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909).

7. Install the Fuel Tube, Second Stage Pump Inlet Elbow to Recirculation Valve (Item 51, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.508).

- (1) Position the tube (73-13-09/1-190) to the engine between the second stage pump inlet and recirculation valve.
- (2) Insert the seal plate (73-13-09/1-210) between the tube flange and the valve mounting face. Secure the tube flange and seal to the valve with bolts (73-13-09/1-200) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Torque-tighten the tube union nut to the pump inlet to between 220 and 240 lbf in. (24,8 and 27,1 N.m). (Tool 1648 and 1752). Wire-lock nut.
- (4) Assemble three loop clamps (73-13-09/1-10-80-120) to the tube and secure at the following positions:
- (a) Attach clamp to the bracket (72-31-01/4-430) mounted on the LP case front blow-off flange with the existing, loosely assembled pillar bolt, washer and nut (73-13-09/1-150-140-130).
- (b) Attach clamp to the bracket (72-31-01/5-300) mounted on the LP case/rear blow-off flange with the existing, loosely assembled pillar bolt, washer and nut.

- (c) Attach clamp to the underside of the bracket (72-31-01/6-340) mounted on the LP case rear flange with the bolt, washer and nut (73-13-09/1-40-30-20), securing the oil return, RH gearbox to tank.
- (d) Torque-tighten the nuts and bolts retaining the loop clamps to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (5) Ensure that a clearance of 0.080 in. (2,0 mm) exists between the tube and the rear loop clamp support bracket.

8. Install the Fuel Tube, Reheat Fuel Controller to Three-way Connector (Item 52, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolt.

B. Installation (Ref.Fig.509).

- (1) Position the tube (73-13-08/1-220) (Ref.SB.71-2) to the engine between the LP sensing valve union on the FCU to the three-way connector on the reheat controller. Secure the tube union nuts.
- (2) Assemble a loop clamp (73-13-08/1-140) to the tube and oil tank overboard vent support bracket (75-02-02/1-70). Secure the clamp to the bracket with bolt, spacer, washer and nut (73-13-08/1-180-170-160-150) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) (Tool 1664 and 909).
- (3) Torque-tighten and wire-lock the tube union nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m).

9. Install the Fuel Tube, Reheat Fuel Controller and FCU to First Stage Pump Inlet Elbow (Item 53, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.509).

- (1) Position the tube section (73-13-08/1-440) to the engine FCU forward along the bottom of the engine. Hand tighten the rear tube union nut to the union of the tube secured to the FCU.
- (2) Assemble the loop clamp (73-13-08/1-370) to the tube and the clip nut (73-13-08/1-400) to the bracket (72-31-01/6-380) mounted on the LP case/exhaust guide vanes case flange. Secure the loop clamp to the bracket with bolt and washer (73-13-08/1-380-390) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Assemble the loop clamp (73-13-08/1-300) to the tube and bracket (72-01-03/5-270) mounted on the HP and LP turbine bearing oil feed elbow on the left-hand gearbox. Secure the loop clamp and clamp (73-13-13/1-110) with the common bolt, washers and nut (73-13-08/1-330-320-310) lightly tightened.
- (4) Position the tube (73-13-08/1-450) on the engine between the first installed tube section and the first stage pump inlet elbow, hand tighten the tube union nut.
- (5) Insert the seal plate (73-13-08/1-470) between the tube flange and the pump inlet elbow mounting face. Secure the tube and seal plate to the elbow with bolts (73-13-08/1-460) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Torque-tighten and wire-lock the tube union nuts to between 400 and 440 lbf in. (45,2 and 49,7 N.m) (Tools 1648, 1528 and 947).

- (7) Ensure that a clearance of 0.100 in. (2,5 mm) exists between the tube and the left-hand gearbox casing at the clipping position on the LP and HP turbine bearings oil feed elbow.

10. Install the Second Stage Pump Air/Fuel Drain Tube (Item 54, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.510).

- (1) Assemble the bracket (73-23-01/1-70) to the reheat control unit elbow flange, retain with bolts (73-23-01/1-60) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Assemble the seal plate and elbow (71-73-03/1-90-80) to the pump mounting face. Secure the elbow and seal plate to the pump with bolts (71-73-03/1-60-70) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Assemble the tube (71-73-03/1-50) (Ref.SB.71-2) between the elbow mounted to the pump and the drain tank union on the air/fuel separator body. Lightly tighten the tube union nuts.
- (4) Assemble the loop clamp (71-73-03/1-10) to the tube and bracket mounted on the reheat control unit elbow flange. Secure with the existing bolt, washer and nut and lightly tighten.
- (5) Torque-tighten the tube union nuts to between 50 and 55 lbf ft (68 and 74 N.m) (Tools 1656, 1529 and 948). Wire-lock the union nuts.

11. Install the First Stage Pump and FCU Gland Drain Tube to the Second Stage Pump Drain (Item 55, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union and bolt threads.

B. Installation (Ref.Fig.511).

- (1) Position the tube (71-73-04/1-100) between the FCU and second stage pump drain pipe and lightly tighten the tube union nuts.
- (2) Assemble the fluid passage bolt (71-73-04/1-10) and two sealing washers (71-73-04/1-20) to the tube connection and attach the connection to the first stage pump with the bolt lightly tightened.
- (3) Assemble the loop clamp (71-73-04/1-30) to the tube and bracket (72-65-00/1-220) mounted on the left-hand gearbox/main oil pump flange. Secure the loop clamp to the bracket with bolt, washer and nut (71-73-04/1-60-50-40) torque-tightened to between 85 and 95 lbf in. (7,6 and 10,7 N.m).
- (4) Torque-tighten the fluid passage bolt to between 210 and 230 lbf in. (23,7 and 26,0 N.m).
- (5) Torque-tighten the tube union nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tools 1648 and 909), then wire-lock.

12. Install the Drains Tank Re-ingestion Tube from the Recirculation Valve to the First Stage Pump (Item 56, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.512).

- (1) Assemble the tube (73-13-11/2-170) to the recirculation valve and lightly tighten the union nut.
- (2) Assemble the tube (73-13-11/2-80) to the first stage pump and tube (2-170) and lightly tighten the union nuts.

- (3) Assemble clip nuts (73-13-11/2-20-120) to the brackets mounted on:
- (a) The LP case blow-off flange (72-31-01/5-460).
  - (b) The oil scavenge tubes, pump to cooler joint flange (79-22-02/1-270).
- (4) Assemble a loop clamp (73-13-11/2-10-90) to each tube, align with the previous brackets.
- (5) Secure the loop clamps to the brackets with bolts and washers (73-13-11/2-40-100-30-110) to the clip nuts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Assemble the nut, pipe closure assembly, (73-13-11/2-160) to the rear tube.
- (7) Torque-tighten:
- (a) The pipe closure nut between 220 and 240 lbf in. (24,8 and 27,1 N.m).
  - (b) The tube union nuts between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tools 1648, 909 and 1752).
  - (c) Wire-lock the pipe closure nut and the tube union nuts.
- (8) Position the tube (73-13-11/1-500) to the re-ingestion pump and tube (73-13-11/1-490) to the previous tubes rear union. Lightly tighten the tube union nuts.
- (9) Assemble three loop clamps (73-13-11/1-450-380) to the rear tube and secure to the brackets:
- (a) Attach to the bracket (72-33-01/6-270) mounted on the intermediate case/HP case flange with the existing bolt, washer and nut.
  - (b) Attach to the bracket (72-01-03/5-270) mounted on the HP turbine bearing oil feed elbow on the port gearbox with the existing bolt, washer and nut.
  - (c) Attach to the bracket (72-33-01/4-230) mounted on the HP case, with the bolt, washer and nut (73-13-11/1-410-400-390).

- (d) Torque-tighten the nuts and bolts securing the clamps to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (10) Position the tube (73-13-11/1-370) to the engine HP case/delivery case and lightly tighten the front union nut to the previous tube connection.
- (11) Assemble four loop clamps (73-13-11/1-300-190-230-190) to the tube and secure to the brackets:
  - (a) Attach to the starter pump front mounting bracket (72-33-01/5-90) with the pillar bolt and nuts (73-13-11/1-330-310).
  - (b) Attach to the bracket (72-33-01/7-140) mounted on the HP case front/rear case joint flange, with the existing bolt and washer and clipnut.
  - (c) Attach to the bracket (72-33-01/8-250) mounted on the HP case/delivery case flange. Assemble the clipnut (73-13-11/1-260) to the bracket and attach the clamp to the bracket with bolt and washer (73-13-11/1-240-250) and clipnut.
  - (d) Attach to the bracket (72-42-01/3-400) mounted on the delivery case/CCOC flange with the existing bolt, washer and nut.
  - (e) Torque-tighten the clamp nuts and bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (12) Position the tube (73-13-11/1-180) to the engine CCOC and secure the tube front union nut to the previous tube lightly tightened.
- (13) Assemble the loop clamp (73-13-11/1-110) to the tube, and bracket (75-02-03/1-90) mounted at the HP and LP turbine bearing cold vent overboard connection. Secure the clamp to the bracket with the bolt, washer and nut (73-13-11/1-140-130-120). Torque-tighten the nut and bolt to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (14) Position the tube (73-13-11/1-100) to the engine between the previous tube and the drains tank and screw union nuts on hand tight.

OLYMPUS 593

MK.610-14-28

OVERHAUL

(15) Assemble two loop clamps (73-13-11/1-10) to the tube and secure them to the brackets:

- (a) Attach the clamp to the bracket (72-42-01/1-260) mounted on the centre support locating position on the CCOC bottom intrascope blank with the bolt, washer and nut (73-13-11/1-50-30-20).
- (b) Attach the clamp to the lug on the centre support tube with the pillar bolt, spacer, washer and nut (73-13-11/1-60-40-30-20).
- (c) Torque-tighten the nuts and bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(16) Torque-tighten:

- (a) The union nut at the re-ingestion pump to between 220 and 240 lbf in. (24,8 and 27,1 N.m).
- (b) All the other tubes union nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m).
- (c) Wire-lock all the tubes union nuts.

13. Install the Fuel Feed Tube, Adapter Block and Engine Flowmeter - FCU to Distribution and Dump Valve (Item 57, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the union threads and lubricant 'B' to the bolts.
- (2) Record the type and serial number of the flowmeter on the accessory sheet.

B. Installation (Ref.Fig.513).

- (1) Position the seal plate and adapter (73-13-02/1-270-240) to the FCU mating face. Secure the adapter and seal plate with bolts (73-13-02/1-250) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

SEAL PLATE

This diagram illustrates the assembly of the FCU to flowmeter tube assembly. The main components shown are the FCU (Fuel Control Unit), the Engine Fuel Flowmeter, and the FCU to Flowmeter Tube Assembly. The assembly includes two Seal Plates, an Adapter, and a Nut Plate Assembly. The FCU is connected to the Engine Fuel Flowmeter via a tube. The FCU to Flowmeter Tube Assembly is shown with its various components, including the Seal Plate, Adapter, and Nut Plate Assembly. The diagram is labeled with CR 33214/000A.

- (2) Position the seal plate and flowmeter (73-33-01/1-100-10) to the distribution and dump valve. Secure with the bolts and washers (73-33-01/1-20-30-40). Install the two smaller diameter washers under the boltheads in the lower bolt-holes of the flange. Torque-tighten the bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Position the tube (73-13-02/1-110) on engine, locate the seal plate (73-13-02/1-220) between flanges and secure tube to adapter with bolts (73-13-02/1-120-130) and nuts (73-13-02/1-260) lightly tightened.
- (4) Carefully insert seal plate (73-13-02/1-230) between tube and flowmeter flanges, position nut plate assembly (73-13-02/1-170) against flowmeter flange and secure with lightly tightened nut and bolt (73-13-02/1-140-150).
- (5) Assemble three bolts (73-13-02/1-150) through fuel tube and flowmeter flanges to engage with the three nuts of nut plate assembly. Lightly tighten the bolts. Assemble bolts (73-13-02/1-160) at the remaining two locations and lightly tighten.
- (6) Torque-tighten tube flange bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Secure the tube to the oil tank overboard vent tube support bracket (75-02-02/1-70) with the bolts and nuts (73-13-02/1-100-105-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Assemble the loop clamp (73-13-02/1-10) to the tube and bracket (73-13-08/1-280) mounted on the zero 'G' valve and FCU fuel tube. Secure with the bolt, washer and nut (73-13-02/1-40-30-20) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (9) Assemble the blanking ferrule (73-13-02/1-80) to the tube union at the elbow near the flowmeter. Torque-tightened to between 190 and 210 lbf in. (21,5 and 23,7 N.m) and wire-lock (Tool 909).

NOTE: A coupling piece may be fitted in lieu of the flowmeter for engine testing and transit. The test bench facilities being used for fuel flow recording.

14. Install Fuel Outlet Tube, Distribution and Dump Valve to FCU Tube Union. Emergency Dump Valve Servo (Item 58, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.514).

- (1) Position the tube (73-13-10/1-280) between the distribution and dump valve mounting face and the main fuel feed tube union and screw on the union nut hand tight.
- (2) Insert the seal plate (73-13-10/1-310) between the tube flange and mounting face and secure the seal and flange with bolts (73-13-10/1-290-300) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock the bolts.
- (3) Torque-tighten the tube union nut to between 190 and 210 lbf in. (21,5 and 23,7 N.m) and wire-lock it (Tools 1664 and 909).
- (4) Assemble the loop clamp (73-13-10/1-210) to the tube and bracket (72-33-01/7-170) on the HP case front/rear joint flange. Secure the clamp to the bracket with the existing bolt, washer and clipnut (73-13-10/1-220-230-240) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

15. Install Oil Scavenge Tubes, Oil Pump Housing to HP Compressor Diffuser Casing, HP Turbine Bearing (Item 59, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.
- (2) Record the type and serial number of the temperature bulb on the accessory sheet.

## B. Installation (Ref.Fig.515).

- (1) Position the tube and gasket (72-01-04/4-10-25) to the oil pump housing mounting face. Secure the tube flange to the housing with bolts (72-01-04/4-20), torque-tightened to between 60 and 65 lbf in. (6,8 and 7,3 N.m).
- (2) Position the tube (72-01-04/4-90) between the previous tube and the delivery case union, lightly tighten the tube union nuts.
- (3) Assemble the loop clamp (72-01-04/4-30) to the tube and bracket on tray assembly (71-51-01/10-200) mounted on the HP case stage five duct. Assemble the clipnut (72-01-04/4-50) to the bracket. Retain the clamp to the bracket with the bolt (72-01-04/4-40) and nut lightly tightened.
- (4) Torque-tighten the tubes union nuts to between 400 and 440 lbf in. (45,2 and 49,7 N.m) and wire-lock (Tools 1528, 947 and 1648).
- (5) Assemble the gasket to the oil thermometer (77-23-02/1-60-40). Position the thermometer in the tube (72-01-04/4-90) and secure with bolts (77-23-02/1-50) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) and wire-lock.

16. Install Oil Scavenge Tube, Oil Pump Housing to LP Turbine Bearing (Item 60, Fig.501 of Stage 1)

## A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

## B. Installation (Ref.Fig.516).

- (1) Position the tube (72-01-04/3-110) to the bottom rear of the engine, secure the rear tube union with the union nut mounted to the exhaust diffuser case lightly tightened.
- (2) Assemble the loop clamp (72-01-04/3-10) and the half clamp shells (72-01-04/3-75) (SB.0L.593-75-8972-27 standard) to the tube and bracket (72-53-00/6-250) mounted on the CC0C/exhaust diffuser flange. Secure the clamp to the bracket with bolt, washer and nut (72-01-04/3-40-30- 20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (3) Position the tube (72-01-04/3-350) to the bottom of the engine between the oil pump housing mounting face and the rear tube, lightly tighten the union nut securing the tubes together.
- (4) Insert a gasket (72-01-04/3-390) between the tube flange and the oil pump housing mounting face. Position the bracket (72-01-04/3-380) to the tube flange. Secure the bracket, tube flange and gasket to the oil pump face with bolts (72-01-04/3-370-360) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and wire-lock.
- (5) Assemble a clipnut (72-01-04/3-310) to the support bracket (75-01-04/1-70) on the HP casing stage five duct. Assemble a loop clamp (72-01-04/3-270) and the half clamp shells (72-01-04/3-345) (SB.0L.593-75-8972-27 standard) to the tube and secure to the clipnut and bracket with a bolt, washer and spacer (72-01-04/3-280-290-300). Torque-tighten the bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Assemble a loop clamp (72-01-04/3-130) and the half clamp shells (72-01-04/3-195) (SB.0L.593-75-8972-27 standard) to the tube and bracket (72-42-01/3-400) mounted on the LP/HP turbine bearing cold vent connector. Secure the clamp to the bracket with bolt, washer and nut (72-01-04/3-160-150-140) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (7) Assemble a loop clamp (72-01-04/3-200) and the half clamp shells (72-01-04/3-265) (SB.0L.593-75-8972-27 standard) to the tube and bracket (75-02-03/1-90) on the delivery case/CCOC flange. Secure the clamp to the underside of the bracket with the pillar bolt, washer and nut (72-01-04/3-230-220-210). Torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (8) Position the gasket and blank (72-01-04/3-105-100) to the rear tube flange and secure with bolts (72-01-04/3-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and wire-lock.
- (9) Torque-tighten the tubes union nuts to between 490 and 550 lbf in. (55,4 and 62,1 N.m) (Tools 1648, 947, 946, 1528 and 1526) and wire-lock.

17. Install the Electrical Harness Support Bracket and Clamping of IDG Oil Tube (Item 61, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts unless stated otherwise.

B. Installation (Ref.Fig.517).

- (1) Position the bracket (71-51-01/10-100) to the tray and bracket (71-51-01/10-200-280) assembled to the HP case/delivery case flange. Retain the bracket with:
  - (a) Two nuts (71-51-01/10-110) securing the front of the bracket to the anchor bolts on the tray (Pre-SB.71-18). A nut and bolt (71-51-01/10-270B/275) securing the front of the bracket to the anchor nut and bolt on the tray (SB. 71-18). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (b) Install the bolt and nut (71-51-01/10-150-140) securing the brackets rear right-hand side to the bracket (72-33-01/8-280) mounted on the HP compressor case rear lower flange. Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (c) The pillar bolt and nuts (71-51-01/10-130-120) retaining the loop clamp (79-22-04/2-80) to the IDG-CSD oil tube.
    - (i) Loosen the nut securing the loop clamp and remove the other nut from the pillar bolt.
    - (ii) Assemble the pillar bolt and nut to secure the brackets rear left-hand side.
    - (iii) Torque-tighten to between 120 and 130 lbf in. (13,6 and 14,7 N.m).
    - (iv) Torque-tighten the loop clamp nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (2) Secure the reheat purge air tube, (delivery case to solenoid), to the bracket (71-51-01/10-100) with the loop clamp (75-03-02/2-10) existing pillar bolt, washer and nut (75-03-02/2-40-30-20) with lubricant 'C' applied. Torque-tighten the nut and bolt to 100 lbf in. (11,5 N.m).
- (3) Ensure a minimum clearance of 0.200 in. (5,0 mm) exists between the bracket (71-51-01/10-100) and the rear intermediate casing drain tube.

18. Assemble the Hydraulic Pump Seal Drain Tubes, Adapters Seal Space to Oil Tank Overboard Vent (Item 62, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union connections and lubricant 'B' to the bolt threads.

B. Installation (Ref.Fig.518).

- (1) Position the tube front section (71-79-02/1-60) to the main hydraulic pump adapter and the drain connection on the standby pump adapter. Insert a gasket (71-79-02/1-80) between the tube flange and the main pump adapter and secure with the bolts (71-79-02/1-70) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Engage union nut with adapter and hand tighten.
- (2) Assemble the loop clamp (71-79-02/1-10) and the half clamp shells (71-79-02/1-55) (SB.0L.593-75-8972-27 standard) to the tube and secure the boss on the right-hand gearbox (Ref. Detail E) with the bolt (71-79-02/1-20) (Ref. SB.72-115 Part 8), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Position the tube centre section (71-79-02/1-230) to the tube front section, engage the tube union connection nut and hand tighten.
- (4) Position the tube rear section (71-79-02/1-380) between the oil tank overboard vent and the tube centre section connection and engage and hand tighten the tube union nut and union bolt respectively.

- (5) Assemble two loop clamps (71-79-02/1-90-160) and the half clamp shells (71-79-02/1-155-1-225) (SB.OL.593-75-8972-27 standard) to the tube centre section (Ref. Detail C and D).
- (a) Assemble the rear clamp in front of the bend in the tube and the front clamp approximately one foot in front of the rear clamp.
- (b) Retain the front loop clamp with bolt (Ref. SB.72-115 Part 9), washer and nut (71-79-02/1-120-110-100) and the rear loop clamp with bolt, washer and nut (71-79-02/1-190-180-170) ready for attachment to brackets at a later stage.
- (6) Assemble the loop clamp (71-79-02/1-240) and the half clamp shells (71-79-02/1-305) (SB.OL.593-75-8972-27 standard) to the rear tube and attach to the bracket (71-51-01/10-100) electrical harness support with the bolt, washer and nut (71-79-02/1-270-260-250) lightly tightened (Detail B).
- (7) Pre-SB.OL.593-71-8988-32 standard. Assemble the loop clamp (71-79-02/1-310) and the half clamp shells (71-79-02/1-375) (SB.OL.593-75-8972-27 standard) to the rear tube and secure it to the bracket (73-23-01/1-70), mounted on the reheat fuel controller with the bolt, washer and nut (71-79-02/1-340-330-320) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (8) SB.OL.593-71-8988-32 standard. Assemble the loop clamp (23H) (71-79-02/1-310) and the half clamp shells (71-79-02/1-375) (SB.OL.593-75-8972-27 standard) to the rear tube and the loop clamp (71-51-01/6-200) to the reheat FCU flylead and secure them to the bracket (73-23-01/1-70), mounted on the reheat fuel controller with the bolt, spacer and nut (71-51-01/6-210, 5-165 and 6-180) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (9) Torque-tighten the tube union nuts and union bolt between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909) and wire-lock.

19. Install the Oil Feed Tubes, LP and HP Thrust Bearings, Right-hand Gearbox Accessory Pump (Item 63, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union connections and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.519).

- (1) On an engine to S.B.72-146 standard, ensure that the restrictor is in position in the tube in the intermediate case vane and is clean and free from obstruction before connecting tubes.
- (2) Position the tube section (72-01-03/2-70) on the engine and engage the tube union nut with the union on the front bearing feed tube (Detail E). Hand-tighten the union nut.
- (3) Hold the tube (72-01-03/2-240) in position between the connection on the intermediate case at vane two and the installed tube (2-70) connection. Hand tighten the tube union nuts.
- (4) Assemble a loop clamp (72-01-03/2-10) to the first installed tube section (Detail D) and attach to the bracket (72-31-01/5-200), mounted on the LP case rear blow-off flange, using the bolt and nut (72-01-03/2-30-20) loosely assembled pending electrical cable installation.
- (5) Assemble the loop clamp (72-01-03/2-170) to the tube section (72-01-03/2-240) and secure to the bracket (72-31-01/6-210), mounted on the LP case rear flange, with the bolt, washers and nut (72-01-03/2-200-190-180) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) (Ref. Detail A).
- (6) Assemble the loop clamp (72-01-03/2-100) to the tube section (72-01-03/2-240) and secure to the bracket (72-31-01/6-180), on the LP case rear flange, with the bolt, washer and nut (72-01-03/2-130-120-110) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) (Ref. Detail B).
- (7) Torque-tighten the tubes union nuts to between 400 and 440 lbf in. (45,2 and 49,7 N.m) (Tools 1648, 947 and 1528) and wire-lock.

- (8) Position the tube section (72-01-03/2-80) between the accessory pump feed mounting face on the right-hand gearbox and the union connection on the tube section (72-01-03/2-240) and engage the union nut hand tight.
- (9) With the gasket (72-01-03/2-95) between the tube flange and pump face (Detail C) secure the flange and gasket with bolts (72-01-03/2-90) torque-tightened to between 80 and 90 lbf in. (9,0 and 10,2 N.m).
- (10) Torque-tighten tube union nut to between 310 and 340 lbf in. (35,0 and 38,4 N.m) (Tools 322 and 1565) and wire-lock it.
- (11) Ensure a clearance of 0.050 in. (1,25 mm) exists between the pipe connector and the intermediate case adapters air supply pipe support bracket on the LP case/exit guide vane case flange.

20. Install Scavenge Oil Tube, LP and HP Thrust Bearings  
(Item 64, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the bolts, except bolts (72-01-04/2-20).
- (2) Apply lubricant 'B' to bolts (72-01-04/2-20).

B. Installation (Ref.Fig.520).

- (1) Hold the tube (72-01-04/2-60) in position between the main oil pump housing and intermediate case sump (pulse probe and drive housing).
- (2) With the gasket (72-01-04/2-120) between the mating faces and the bracket (72-01-04/2-110) positioned on the tube flange, attach the bracket, flange and gasket to the sump with bolts (72-01-04/2-90-80) lightly tightened. Use the longer bolts at the bracket location (Detail B).
- (3) Remove the nut and bolt retaining the loop clamp (73-13-03/1-72) to the tube, first stage pump to reheat injection system at the rear of the filter housing. Secure the loop clamp to the bracket (72-01-04/2-110) with the nut and bolt torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (4) With a gasket (72-01-04/2-130) between mating faces, attach the tube flange and gasket to the pump housing with bolts (72-01-04/2-70) lightly tightened.
- (5) Torque-tighten the bolts securing the tube flanges to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Assemble the gasket (72-01-04/2-55) and blank (72-01-04/2-50) to the tube and secure with the bolts (72-01-04/2-40) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock the bolts.
- (7) Position the bracket (72-01-04/2-30) to the tube lug (Detail C) and retain with the bolts and nuts (72-01-04/2-20-10) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,3 N.m).

21. Assemble the Oil Feed Tubes, Pump to Bearing, LP and HP Compressor Thrust Oil Failure Warning (Item 65, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.
- (2) Assemble the clipnut (72-01-03/3-190) to the bracket (72-33-01/6-120) mounted on the intermediate case/HP case flange.

B. Installation (Ref.Fig.521).

- (1) Hold the tube section (72-01-03/3-150) in position with the tube flange aligned to the pulse probe and drive housing (Detail A), insert the gasket (72-01-03/3-170) between the mating faces and secure with bolts (72-01-03/3-160) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,3 N.m).
- (2) Assemble the loop clamp (72-01-03/3-10) and the half clamp shells (72-01-03/3-75) (SB.OL.593-75-8972-27 standard) to the tube and secure to the bracket (72-33-01/6-215), mounted on the intermediate case/HP case flange near the sump, with the bolt, washers and nut (72-01-03/ 3-40-30-20), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

TUBES AND ACCESSORIES - ASSEMBLY

1. Install Cooling Air Tubes, HP Turbine Bearing and LP Turbine Bearing Front Tube (Item 66, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolt threads.

B. Installation (Ref.Fig.501).

- (1) Position the make-up piece (75-01-01/1-260) to the intermediate case elbow and secure with bolts and nuts (75-01-01/1-280-270) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Install HP turbine bearing tube. Ensure that the bracket (72-33-01/5-400) is to the same Service Bulletin standard as the tube.
- (a) Assemble the sealing ring to the tube (75-01-02/1-140-80).
- (b) Assemble the tube to the HP compressor diffuser case elbow (75-01-05/1-20) and the make-up piece lower face.
- (c) Secure the tube to the elbow with the retaining plate, bolts and nuts (75-01-02/1-130-120-110). Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (d) Position the bracket (72-33-01/6-110) to the inner tube flange bolt-hole and intermediate case/HP case flange.
- (e) Attach the bracket and tube flange with the bolt (75-01-02/1-90) and the remaining tube flange positions with bolts (75-01-02/1-100) to the make-up piece, lightly tightened.

OVERHAUL

- (3) Position the bracket (72-33-01/5-400) to the HP compressor case. Secure the bracket with bolts (72-31-01/5-390) or bolts and washers (72-33-01/5-390-395) lightly tightened.
- (4) Assemble the loop clamp (75-01-02/1-10) and the half clamp shells (75-01-02/1-75) (SB.0L.593-75-8972-27 standard) to the tube and secure to the bracket (72-33-01/1-400) on the HP case with the bolt, washer and nut (75-01-02/1-40-30-20). Torque-tighten the nut and bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (5) Torque-tighten the bolts securing the bracket (para.3.) between 85 and 95 lbf in. (9,6 and 10,7 N.m).

C. Install the LP Turbine Bearing Tube.

- (1) Position the tube (75-01-01/1-300) to the bracket (72-33-01/6-110) and the make-up piece. Locate bolt (75-01-01/1-310) at bracket position and bolts (75-01-01/1-320) at remaining positions and attach bracket and tube flange to make-up piece with bolts lightly tightened.
- (2) Assemble the loop clamp (75-01-01/1-190) and the half clamp shells (75-01-01/1-255) (SB.0L.593-75-8972-27 standard) to the tube and secure to the bracket (72-33-01/7-50) mounted on the HP case front/rear joint flange with bolt, washer and nut (75-01-01/1-220-210-200) torque-tightened to between 85 and 95 lbf in. (9,2 and 10,7 N.m).
- (3) Secure the bracket (72-33-01/6-110) to the intermediate case/HP case flange with the existing bolts and nuts (72-33-01/6-130-100) torque-tightened to between 85 and 95 lbf in. (9,2 and 10,7 N.m).
- (4) Torque-tighten nuts and bolts securing the tubes flanges and brackets to between 80 and 90 lbf in. (9,0 and 10,2 N.m).

## 2. Install Cooling Air Tubes, LP Turbine Bearing Rear Tube (Item 67, Fig.501 of Stage 1)

### A. Prepare for Installation.

- (1) Apply lubricant 'C' to the tube union threads and to the nuts and bolts (72-53-00/1-10-30) securing the elbow and bracket (72-53-00/1-40-50). Apply lubricant 'B' to the remaining bolts.

### B. Installation (Ref.Fig.501).

- (1) Assemble the seal ring to the tube (75-01-01/1-180-150).
- (2) Position the tube between the turbine shroud elbow (72-53-00/1-50) and the tube (75-01-01/1-300) mounted to the right-hand HP case and lightly tighten the tube union nut to the forward tube.
- (3) Secure the tube to the elbow with the retaining plate and bolt (75-01-01/1-170-160) torque-tightened to between 60 and 65 lbf in. (6,8 and 7,3 N.m). Wire-lock the bolt.
- (4) Torque-tighten the loosely assembled nuts (72-53-00/1-10) securing the elbow and bracket (72-53-00/1-50-40) to 100 lbf in. (11,5 N.m).
- (5) Assemble the loop clamp (75-01-01/1-10) and the half clamp shells (75-01-01/1-75) (SB.0L.593-75-8972-27 standard) to the tube, align and secure to the bracket (72-53-00/5-160) mounted on the CC0C/exhaust diffuser flange using bolt, washer and nut (75-01-01/1-40-30-20). Torque-tighten the nut and bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Assemble the loop clamp (75-01-01/1-80) and the half clamp shells (75-01-01/1-145) (SB.0L.593-75-8972-27 standard) to the tube and secure to the bracket (72-42-01/3-140) mounted on the delivery case/CC0C flange using bolt, washer and nut (75-01-01/1-110-100-90). Torque-tighten the nut and bolt to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Torque-tighten the tube union nut to between 50 and 55 lbf ft. (68 and 74 N.m), (Tools 1658, 948 and 1529) wire-lock the union nut.

### 3. Install Air Ducts and Tubes, Venting (Item 68, Fig.501 of Stage 1)

#### A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and to the pillar bolt and nut (72-53-00/1-160-150) attached to bracket (72-53-00/1-200). Apply lubricant 'B' to the remaining bolts.

#### B. Installation (Ref.Fig.502).

- (1) HP compressor diffuser case venting air duct, left-hand.
  - (a) Assemble the seal ring to the duct (75-02-07/1-70-10).
  - (b) Position the duct to the HP compressor diffuser case duct (75-02-12/1-10) and secure with retaining plate, bolts and nuts (75-02-07/1-40-30-20). Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Assemble the support link (75-02-07/1-100) to the duct lower lug, retain with bolt and nut (75-02-07/1-60-50). Position the bracket (75-02-07/1-110) to the support link and the support tube (72-42-01/1-290) and attach them with bolts and nuts (75-02-07/1-90-80).
  - (d) Attach the lugs on the duct to the bracket (72-42-01/4-310) mounted on the CC0C forward flange with the bolts and nuts (75-02-07/1-60-50).
  - (e) Torque-tighten all the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Exhaust diffuser to left-hand tube (Ref.Fig.503).
  - (a) Remove the loosely assembled nuts securing the elbow mounted at vane seven, remove the elbow (72-53-00/2-120). Ensure the gasket (72-53-00/2-125) fitted to the exhaust diffuser mounting face is undamaged.

- (b) Assemble the seal rings to each end of the tube (75-02-05/1-140-80), and the elbow to the tube.
  - (c) Position the tube and elbow between the previous duct (75-02-07/1-10) and the exhaust diffuser mounting face.
  - (d) Position the brackets (72-53-00/2-110-115) to the elbow and secure with the nuts torque-tightened evenly in sequence to 100 lbf in. (11,5 N.m).
  - (e) Secure the tube to the elbow with retaining plate and bolt (75-02-05/1-130-120). Torque-tighten the bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and wire-lock.
  - (f) Position the bracket (75-02-05/1-110) to the tube (75-02-05/1-80) and duct (75-02-07/1-10) and secure the bracket to the duct with bolts and nuts (75-02-05/1-100-90) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (g) Secure the loop clamps (75-03-02/1-310, 72-01-03/4-120 and 73-13-03/2-10) to the bracket (75-02-05/1-110) using the pillar bolt, washers and nut (72-01-03/4-150-140-130) securing the loop clamps together, torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (h) Assemble the loop clamp (75-02-05/1-10) and the half clamp shells (75-02-05/1-75) (SB.OL.593-75-8972-27 standard) to the tube align and retain to the bracket (72-53-00/ 7-250) mounted on the CC0C/HP turbine case flange with the bolt, washer and nut (75-02-05/ 1-40-30-20). Torque-tighten the nut and bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Compressor diffuser case venting air duct, right-hand (Ref.Fig.504).
- (a) Assemble the seal ring to the duct (75-02-06/1-80-10).

- (b) Assemble the duct to the delivery case duct (75-02-12/1-50) and secure with retaining plate, bolts and nuts (75-02-06/1-50-40-30-20). Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (c) Secure the duct to the support tube (72-42-01/1-270) with bolts and nuts (75-02-06/1-70-60) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (4) Exhaust diffuser right-hand duct (Ref.Fig.505).
- (a) Remove the loosely assembled nuts and elbow (72-53-00/1-220). Ensure the gasket (72-53-00/1-225) fitted to the exhaust diffuser case is undamaged.
- (b) Assemble the seal rings to the tube (75-02-04/1-140-80) and assemble the elbow to the tube.
- (c) Position the tube and elbow between the duct (75-02-06/1-10) mounted on the bottom of the HP compressor diffuser case and the exhaust diffuser case.
- (d) Position the brackets (72-53-00/1-200-210) to the elbow flange. Secure the brackets and elbow to the exhaust diffuser case with nuts (72-53-00/1-170) with lubricant 'C' applied to threads. Torque-tightened nuts in sequence to 100 lbf in. (11,5 N.m).
- (e) Assemble the pillar bolt to the bracket (72-53-00/1-160-200) and secure with a nut (72-53-00/1-150) torque-tightened to 100 lbf in. (11,5 N.m). Assemble a nut (72-53-00/1-150) to the pillar bolt and hand-tighten.

OLYMPUS 593 

MK.610-14-28 *snecma*  
OVERHAUL

- (f) Retain the tube to the rear elbow with the retaining plate and bolt (75-02-04/1-130-120). Torque-tighten the bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and wire-lock.
- (g) Retain the tube to the forward duct with the retaining plate, bolts and nuts (75-02-04/1-110-100-90). Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (h) Assemble the loop clamp (75-02-04/1-10) and the half clamp shells (75-02-04/1-75) (SB.0L.593-75-8972-27 standard) to the tube and secure to the bracket (72-53-00/6-150) on the CCOC/exhaust diffuser case flange with bolt, washer and nut (75-02-04/1-40-30-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

#### 4. Positional Checks of the Fuel - Air - Oil Overboard Vents and Ducts

NOTE: These operations can only be carried out if the following items are assembled to the engine:

Fuel heater overboard duct.  
Oil tank overboard outlet.  
LP and HP compressor thrust bearing cold vent outlets.  
HP and LP turbine bearing cold vent outlets.  
The number twelve labyrinth outlet.  
Right and left turbine hot vents.  
Fuel drains tank overboard outlet.

##### A. Fuel Heater Overboard Duct and Oil Tank Vent.

- (1) Assemble the front gauging bracket using the sling (Tools 1760 and 1758) to the two brackets mounted to the lower delivery case/CCOC flange and intake case/LP case flange (Tool 1756). Secure with the nuts and bolts provided.
- (2) Using the gauge (Tool 1761) in conjunction with the gauging bracket check the fuel heater overboard duct position.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (3) Using the gauge (Tool 1762) check the position of the oil tank overboard duct position.

NOTE: When the vents do not fall in the limits of the gauges the tubes and securing brackets can be loosened, the vents repositioned and the tubes and brackets re-tightened and locked.

- (4) Remove the front gauging bracket loosely securing the bolts and nuts to the bracket, replace gauges in container (Tool 1757).

B. LP and HP compressor bearing vents and HP and LP turbine bearing vents and number twelve labyrinth and drains tank overboard vents.

- (1) Assemble the rear gauging bracket (Tool 1763) to the three brackets mounted on the delivery case/CCOC flange and the bracket on the CCOC/exhaust diffuser flange using the sling (Tool 1758). Secure with the nuts and bolts provided.
- (2) Using the gauge (Tool 1764) in conjunction with the gauging bracket check the LP and HP compressor thrust bearings cold vent outlet position.
- (3) Using the gauge (Tool 1764) check the LP and HP turbine cold vent outlet position.
- (4) Using the gauge (Tool 1765) check the number twelve labyrinth left and right-hand positions.
- (5) Using the gauge (Tool 1766) check the drains tank overboard outlet position.

NOTE: When the vents do not fall in the limits of the gauges the tubes and securing brackets can be loosened, the vents repositioned and the tubes and brackets re-tightened and locked.

- (6) Remove the rear gauging bracket loosely secure the bolts and nuts to the bracket, replace gauges in container (Tool 1759).

5. Assemble the Reheat Fuel Tube, Reheat Fuel Controller to Spray Ring to the Engine (Item 69, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts unless stated otherwise.

B. Installation (Ref.Fig.506).

- (1) Position the tube (73-13-03/2-240) at the controller, along the bottom of the engine to the exhaust diffuser case. Finger-tighten the tube union nut to the controller connector.
- (2) Assemble the four loop clamps (73-13-03/2-10-50-90-170) to the tube and secure to the brackets as follows:
  - (a) Left-hand exhaust diffuser air vent duct bracket (75-02-05/1-110), attach the clamp (73-13-03/2-10) using the existing pillar bolt and nut (72-01-03/4-150-130).
  - (b) CC0C/HP turbine case flange bracket (72-53-00/7-250), attach the clamp using the existing pillar bolt, distance piece and nut (75-03-02/1-200-195-190) with lubricant 'C' applied.
  - (c) LP shaft signal system pulley shroud flange on the diffuser bracket (76-21-02/1-40), attach the clamp with bolt, washer and nut (73-13-03/2-120-110-100) to the bracket.
  - (d) Exhaust diffuser adapter flange bracket (72-54-01/3-120), attach the clamp with bolt, washer and nut (73-13-03/2-200-190-180).
  - (e) Torque-tighten the pillar bolt, distance piece and nut (75-03-02/1-200-195-190) to 100 lbf in. (11,5 N.m).
  - (f) Torque-tighten the other nuts and bolts securing the clamps to the brackets between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Torque-tighten the tube union nut to between 50 and 55 lbf ft (68 and 74 N.m) (Tools 1656, 948 and 1529) and wire-lock.

- (4) Screw on the ferrule assembly (73-13-03/2-160) to the tube union. Torque-tighten the ferrule between 190 and 210 lbf in. (21,5 and 23,5 N.m) (Tool 909) and wire-lock.

## 6. Install the Electrical Tray (Item 70, Fig.501 of Stage 1)

### A. Prepare for Installation.

- (1) Apply lubricant 'B' to the bolts.

### B. Installation.

- (1) Remove the loosely assembled nut from the pillar bolt which also secures the oil, air and fuel tubes to the bracket (75-02-05/1-110) on the left-hand air vent front flange.
- (2) Position the rear flange of the electrical tray (71-51-01/7-180) to the pillar bolt and secure with the nut finger-tight.
- (3) Assemble the loop clamp (71-51-01/7-40) to the reheat purging air tube (75-03-02/1-420) in alignment with the forward pointing lug on the electrical tray and attach with bolt, washer and nut (71-51-01/7-70-60-50).
- (4) Assemble the two loop clamps (71-51-01/7-110) to the LP turbine bearing oil feed tube (72-01-03/4-330) align with the centre and forward holes in the electrical tray. Attach the loop clamps to the tray using bolts, washers and nuts (71-51-01/7-140-130-120).
- (5) Torque-tighten all the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

## 7. Install the Air Valve and Anti-icing Tubes (Item 71, Fig.501 of Stage 1)

### A. Prepare for Installation.

- (1) Record the type and serial number of the air valve on the accessories sheet.

OVERHAUL****B. Install Anti-icing Tubes (Ref.Fig.507).**

- (1) Apply lubricant 'A' to the bolt and secure threads.
- (2) Assemble the seal ring (75-11-02/1-170) to the tube (75-11-02/2-110).
- (3) Remove the nut, bolt and retaining plate (75-11-02/2-120-130-140) from the manifold inlet on the intake casing.
- (4) Assemble the tube to the manifold inlet and secure with the retaining plate, bolt and nut. Torque-tighten the nut and bolt to 100 lbf in. (11,5 N.m).
- (5) Assemble the clipnut (75-11-02/2-70) to the bracket (72-31-01/5-30) mounted on the LP casing rear blow-off flange. Assemble the loop clamp (75-11-02/2-40) to the tube, align and secure to the bracket using bolt and washer (75-11-02/2-50-60) and clipnut, torque-tighten the bolt to 100 lbf in. (11,5 N.m).
- (6) Assemble the seal ring (75-11-02/1-170) to the rear tube (75-11-02/1-160) (Pre or SB.72-17 standard).
- (7) Assemble the tube, to the previous tube, secure using retaining plate, bolts and nuts (75-11-02/2-30-20-10) simultaneously securing the tube to the bracket (72-33-01/6-80) mounted on the intermediate case/HP case flange. Torque-tighten the nut and bolt to 100 lbf in. (11,5 N.m).
- (8) Assemble the clipnut (75-11-02/1-120) to the bracket (72-33-01/7-80) mounted on the HP casing front/rear joint flange. Assemble the loop clamp (75-11-02/1-90) and the half clamp shells (75-11-02/1-152) (SB.0L.593-75-8972-27 standard) to the tube, align and secure to the bracket using bolt and washer (75-11-02/1-100-110) and clipnut. Torque-tighten the bolt to 100 lbf in. (11,5 N.m).

- (9) Assemble the loop clamp (75-11-02/1-50) and the half clamp shells (75-11-02/1-85) (SB.0L.593-75-8972-27 standard) to the tube, align and secure to the bracket (72-42-01/3-230) mounted on the delivery case/CCOC flange using the existing bolt, washers and nut, torque-tightened to 100 lbf in. (11,5 N.m).
- (10) Apply a thin film of jointing compound 'A' to the strainer (75-11-02/1-30) joint faces.
- (11) Assemble the strainer to the CCOC case, secure using screws (75-11-02/1-40) and ensure the screw heads are below the flange surface.
- (12) Position the elbow (75-11-02/1-10) to the CCOC case over the strainer and secure with the bolts (75-11-02/1-20) with lubricant 'C' applied. Torque-tighten bolt to 100 lbf in. (11,5 N.m). Wire-lock the bolts.

C. Install the Air Valve, Electrical Tray and Loop Clamp.

- (1) Apply lubricant 'B' to the bolts.
- (2) Install the air valve (SB.75-12 and 75-13).
  - (a) Position the air valve (75-12-01/1-10) between the elbow and rear tube rear flange.
  - (b) Position the bracket (75-12-01/1-100) on the elbow flange and retain the bracket and tube flange to the air valve flange with the bolts (75-12-01/1-35-30).
  - (c) Position the bracket (75-12-01/1-110) on the tube flange and retain the bracket, tube flange and valve flange with the bolts (75-12-01/1-20).
  - (d) Torque-tighten all the bolts between 67 and 73 lbf in. (6,8 and 7,3 N.m).
  - (e) Install the blanking ferrule assembly (75-11-02/1-155A) on the tube connection forward of the valve. Torque-tighten nut to between 190 and 210 lbf in. (21,5 and 23,7 N.m) and wire-lock (SB.71-17 standard).

- (3) Assemble the electrical tray (71-51-01/9-230) (Pre or SB.71-16 standard or SB.71-17 standard to the engine. Fig.507 shows Pre SB.71-16 standard).
- (a) Insert the bolt (71-51-01/9-220) in the central hole, without a flange, in the tray.
  - (b) Align and secure the tray to the bracket (75-12-01/1-110) mounted on the air pressure control valve front flange, using the installed bolt and the nut (71-51-01/9-210) torque-tightened to between 67 and 73 lbf in. (6,8 and 7,3 N.m).
  - (c) Assemble the loop clamp to the bolt (71-51-01/9-200-190).
  - (d) Assemble the bolt (with loop clamp fitted) to the rear hole in the electrical tray and the bracket (75-12-01/1-100) mounted to the air valve rear flange, secure with the nut (71-51-01/9-180) and nip-tighten.
- (4) Install the loop clamp (71-51-01/9-140).
- (a) Assemble the loop clamp to the tube (75-11-02/1-160) and align with the second hole from the front in the tray. Install a loop clamp to the bolt (71-51-01/9-130-120). Attach the loop clamp (71-51-01/9-140) to the tray using the bolt (with loop clamp) washer and nut (71-51-01/9-120-110-100) (Pre SB.71-17).
  - (b) Assemble the loop clamp to the tube and align with the front hole in the tray. Attach the loop clamp to the tray using bolt, washer and nut (71-51-01/9-137-110-135) (SB.71-17 standard).
  - (c) Torque-tighten the nut and bolt between 67 and 73 lbf in. (6,8 and 7,3 N.m).

**NOTE:** Ensure there is a minimum clearance of 0.20 in. (5,08 mm) between the rear tube unit and the HP turbine cooling air tube support bracket on the HP case.

8. Install the Anti-icing Air Pressure Switch and Tube (Item 72, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the tube union threads.
- (2) Record the type and serial number of the anti-icing pressure switch on the accessory sheet (Ref. SB.75-13).

B. Installation.

- (1) Position the switch (75-41-01/1-10) to the bracket (72-31-01/5-190) mounted on the LP case rear blow-off flange. Apply lubricant 'B' to the bolts and nuts (75-41-01/1-30-20), and secure the switch with the nuts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Position the tube (75-11-02/2-220) between the anti-icing pipe and the pressure switch and hand-tighten the union nuts.
- (3) Assemble the two loop clamps (75-11-02/2-150) and the half clamp shells (75-11-02/2-215) (SB.0L.593-75-8972-27 standard) to the tube aligning with the two brackets (72-31-01/5-60-140) mounted on the LP case rear blow-off flange. Apply lubricant 'A' to the bolts and nuts (75-11-02/2-180-160), and secure the clamps to the brackets with bolts, washers (75-11-02/2-170) and nuts torque-tightened to 100 lbf in. (11,5 N.m).
- (4) Triple torque-tighten thrust wire type union nut at the switch to between 90 and 100 lbf in. (10,2 and 11,3 N.m) (Tool 1480), wire-lock the nut.
- (5) Torque-tighten the tube union nut at the anti-icing tube to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tools 909 and 949) and wire-lock the nut.

9. Install the Fuel Drain Tube, Dump Valve to Drains Tank (Item 73, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to tube union threads and to the bolts.

B. Installation (Ref.Fig.508).

- (1) Assemble the sealing ring to the tube (71-73-05/1-120-80). Position the tube between the emergency dump valve drain location and the drains tank connection, finger-tighten the tube union nut. Position the bracket (71-73-05/1-110) to the tube flange, secure the bracket and tube flange to the valve housing using bolts (71-73-05/1-100-90) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Torque-tighten the tube union nut between 310 and 340 lbf in. (35 and 38 N.m) (Tools 1648, 322, 1565) and wire-lock.
- (3) Assemble the loop clamp (71-73-05/1-10) to the tube, align and retain to the bracket (72-42-01/4-280) mounted on the delivery case/CCOC flange using the bolt, washer and nut (71-73-05/1-40-30-20), nip-tighten.

10. Install Engine Fuel System Seal Drain Tubes (Item 74, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.509).

- (1) Assemble the T-piece (71-73-02/3-230) to the bracket (73-11-02/1-10) (Ref. detail A) and secure with bolts and nuts (71-73-02/3-220-210) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Install the connector (71-73-02/4-350) (Ref. detail B).
  - (a) Remove the loosely assembled nut, washer and bolt (71-73-02/4-340-320-310) securing the second stage pump fuel drain tube loop clamp (71-73-03/1-10) to the bracket (73-23-01/1-70) mounted on the reheat controller.

- (b) Secure the loop clamp and connector (71-73-02/4-350) to the bracket.
- (c) Further secure the connector to the bracket using bolt and nut (71-73-02/4-330-310).
- (d) Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Assemble the connectors finger tight to the following positions:
- (a) Fuel inlet elbow (73-12-03/1-70) on the first stage pump (73-11-01/1-10), connector, seal washers and bolt (71-73-02/1-40B-50B-30B).
- NOTE: The fluid passage bolt and connector must be to SB.71-10 standard.
- (b) Drain location on the first stage pump (73-11-01/1-10), one-way connector, seal washers and adapter (71-73-02/1-90-100-80).
- (c) Drain location on the fuel heater and filter (73-14-01/1-10), one-way connector, seal washers and bolt (71-73-02/1-130-140-120).
- (d) Drain location at the main fuel feed tube rear joint flange (73-13-01/1-10), multiple connector, seal washers and bolt (71-73-02/2-160-170-150).
- (4) Assemble the seal washer and adapter (71-73-02/1-170-160) to the drain location in the reheat fuel feed pipe filter housing (73-13-03/1-320).
- (5) Assemble the multiple connector, seal washers and bolt (71-73-02/2-200-210-190) to the throttle valve actuator drain location (F.C.U.) (73-21-01/1-10).

OVERHAUL

(13) Torque-tighten all the tube union nuts:

- (a) Flexible tubes nuts to between 90 and 100 lbf in. (10,2 and 11,3 N.m) (Tool 1767).
- (b) Rigid tube nuts to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909).

NOTE: Thrust wire type union nuts require triple torque-tightening to ensure correct seating. This procedure involves torque-tightening and slackening the nut twice prior to the final torque-tightening.

(14) Wire-lock all the tube union nuts, connector bolts, adapters and union bodies.

11. Install Fuel Drain Tubes, Overboard Spill (Item 75, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant 'A' to the tube union threads and lubricant 'B' to the bolts.

B. Installation (Ref.Fig.510).

- (1) Assemble the adapter (71-73-02/5-480) to the bracket (72-31-01/5-270) mounted on the LP case rear blow-off flange. Secure with the bolts and nuts (71-73-02/5-460-470B-450), torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Position the rigid tube (71-73-02/5-570) to the connector (71-73-02/5-590) mounted to the drains tank, forward along the bottom of the engine. Finger-tighten the tube union nut to the connector.
- (3) Assemble the loop clamp (71-73-02/5-530) to the tube, align and secure to the bracket (72-42-01/3-500) mounted on the delivery case/CCOC flange using the existing bolt, washer and nut, torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (4) Assemble the loop clamp (71-73-02/5-490) to the tube, align and retain to the bracket (75-01-04/1-170) mounted on the HP case/delivery case cooling air tube flange, using the bolt, washer and nut (71-79-01/1-50-30-20). Lightly tighten the nut and bolt.
- (5) Assemble the flexible tube (71-73-02/5-440) between the adapter (71-73-02/5-480) mounted on the LP compressor rear flange, bottom position and the rigid tube, mounted on the HP case/delivery case flange and lightly tighten the union nuts.
- (6) Assemble the seven loop clamps (71-73-02/5-10-80-150-220-310-370-80) to the flexible tube, align and retain to the following bracket locations:

**NOTE:** Alternative standard flexible tube B477568 (Palmer Aero Products) is of smaller outside diameter than flexible tube B477569 (Dunlop), 0.210 in. (5,33 mm) compared to 0.250 in. (6,35 mm). To compensate for the smaller outside diameter, flexible tube B477568 to be bound with Scotch No.27 adhesive tape, 12,0 mm wide, at clipping positions.

- (a) The bracket (73-22-01/1-40) mounted on the blanking plate (SB.71-28). Attach the clamp to the bracket using the bolt, washer and nut (71-73-02/5-40-30-20) lightly tightened.
- (b) The bracket (72-63-01/7-100) mounted on the main hydraulic pump adapter. Install the clipnut (71-73-02/5-110) to the bracket and secure the clamp with the bolt and washer (71-73-02/5-90-100) to the clipnut, torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (c) The bracket (72-63-01/7-270) mounted on the standby pump adapter. Secure the clamp to the bracket using the bolt, washer and nut (71-73-02/5-180-170-160) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (d) The bracket (71-73-02/5-300).
  - (i) Remove the nut, bolt and washer securing the loop clamp (73-13-03/1-80) to the bracket (72-33-01/6-220) mounted on the HP compressor case front flange.
  - (ii) Position the bracket to the bracket on the HP compressor case flange.

ASSEMBLY

STAGE 5

Page 534

Jun 1/99

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (iii) Attach the brackets and loop clamp with the previously removed bolt, washer and nut.
- (iv) Install the bolt and nut (71-73-02/5-290-280) to secure the brackets to each other.
- (v) Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (vi) Install the clipnut (71-73-02/5-240) to the bracket (71-73-02/5-300).
- (vii) Assemble the loop clamp to the tube and attach with the bolt (71-73-02/5-230) to the bracket using the clipnut and lightly tighten.
- (e) The bracket (72-33-01/5-90) mounting the front of the starter pump. Attach the clamp to the bracket using the bolt, and nut (71-73-02/5-330-320) lightly tightened.
- (f) The bracket (72-33-01/5-360) mounting the rear of the starter pump. Attach the clamp to the lug on the bracket using the bolt, washer and nut (71-73-02/5-400-390-380) lightly tightened.
- (g) The bracket (75-01-04/1-60) mounted on the HP casing stage five duct. Assemble the clipnut (71-73-02/5-110) to the bracket and secure the clamp to the bracket using the bolt and washer (71-73-02/5-90-100) and clipnut torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Torque-tighten the tube union nut to the drains tank to between 190 and 210 lbf in. (21,5 and 23,7 N.m) (Tool 909) and wire-lock.
- (8) Torque-tighten the remaining tube union nuts to between 90 and 100 lbf in. (10,2 and 11,5 N.m) (Tool 1767) and wire-lock.

ASSEMBLY

71-00-01

STAGE 5

Page 535

OVERHAUL

- (9) Assemble the pipe closure nut (71-73-02/5-610) to the adapter (71-73-02/5-480) at the front of the flexible tube and torque-tighten to between 90 and 100 lbf in. (10,2 and 11,5 N.m) (Tools 1480 and 1767) and wire-lock.

12. Install the Mounting Brackets, Thermocouples and Leads, Junction Boxes and Thermocouple Harness (Items 78 to 83, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Record the types and serial numbers of the thermocouples and thermocouple harness on the accessory sheet.

B. Installation.

- (1) Mounting brackets and mounting plate (Ref.Fig.511).
- (a) Apply lubricant 'B' to attachment items.
  - (b) Position the bracket (72-42-01/1-10) to the front lug on the centre support tube (72-42-01/1-230). Secure using the bolts and nuts (72-42-01/1-30-20) and torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Position the bracket (72-42-01/1-60) to the lug, second from the front, on the centre support tube. Secure using the bolts and nuts (72-42-01/1-80-70) and torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Position the bracket (72-42-01/1-160) to the rear lug on the right-hand support tube (72-42-01/1-270). Secure using the bolts and nuts (72-42-01/1-180-170) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (e) Position the bracket (72-42-01/1-110) to the lug, second from the rear, on the right-hand support tube. Secure using the bolts and nuts (72-42-01/1-130-120) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (f) Position the mounting plate (77-22-08/1-60) (SB.77-2) to the support brackets mounted on the support tubes and retain with the pillar bolts (77-22-08/1-70) screwed into the anchor nuts secured to the four support brackets.
  - (g) Secure the pillar bolts (short) (77-22-08/1-40) and pillar bolts (77-22-08/1-50) to the anchor nuts on the sides of the mounting plate.
  - (h) Torque-tighten the pillar bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (2) Install the thermocouple (77-22-05/1-50) (Ref. Fig.512).
- (a) Apply lubricant 'B' to thermocouple union nut and to attachment bolts and nuts.
  - (b) Position the thermocouple junction box on the mounting plate and the bulb in the LP turbine bearing hot air vent tube union.
  - (c) Retain the thermocouple junction box to the mounting plate with the bolts (77-22-05/1-60) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Torque-tighten the thermocouple union nut to between 220 and 240 lbf in. (25 and 27 N.m) and wire-lock it.
  - (e) Secure the thermocouple lead-out.
    - (i) Assemble the bushing-halves and the loop clamp (77-22-05/1-40-30) to the thermocouple lead-out.
    - (ii) Secure the lead-out loop clamp to the lug on the right-hand support tube using the bolt and nut (77-22-05/1-20-10).
    - (iii) Torque-tighten the nut and bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
    - (iv) Ensure there is a minimum clearance of 0.500 in. (12,7 mm) between the thermocouple lead and adjacent components and dressing items.

- (3) Install the thermocouple (77-22-04/1-10) (Pre or SB.77-4 standard) (Ref.Fig.513).
  - (a) Apply lubricant 'B' to union nut and attachment items.
  - (b) Position the thermocouple junction box on the mounting plate and the bulb in the LP and HP turbine bearing vent tube union.
  - (c) Secure the thermocouple junction box to the mounting plate with the bolts (77-22-04/1-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (d) Torque-tighten the thermocouple union nut to between 220 and 240 lbf in. (25 and 27 N.m) and wire-lock it.
- (4) Install the thermocouples (77-22-02/1-10) and lead-outs (77-22-03/1-140-290) (Ref.Fig.514).
  - (a) Remove the lead-out junction box covers (77-22-03/1-140-290) and the loosely assembled nuts and washers from the forward junction box on the lead-out (1-290) which is mounted on the right-hand side of the CCOC.
  - (b) Install the lead-outs.
    - (i) Apply lubricant 'B' to attachment items except those used for terminals.
    - (ii) Position the lead-outs to their respective positions on the mounting plate and the CCOC mounting faces and retain with previously removed washers and nuts.
    - (iii) Retain the left-hand lead-out to the mounting plate with bolts (77-22-03/1-150) and the right-hand lead-out with bolts (77-22-03/1-300) lightly tightened.

- (c) Install the thermocouples.
  - (i) Remove the nuts and washers from the lead-out terminals at the CCOC mountings.
  - (ii) Insert the thermocouples (77-22-02/1-10) in the junction boxes and CCOC mounting faces.
  - (iii) Assemble the thermocouples and junction boxes to the CCOC mounting faces using keywashers and bolts (77-22-02/1-30-20) lightly tightened with lubricant 'C' applied.
  - (iv) Secure the thermocouple terminals to the junction box terminal blocks with the previously removed washers and nuts. Torque-tighten nuts between 10 and 15 lbf in. (1,1 and 1,7 N.m).
- (d) Secure the lead-outs to the rear of the mounting plate to the lug on the centre support tube (72-42-01/1-230) with the grooved clamp, spacer, bolt and nut (77-22-03/1-130-110-120-100). Torque-tighten the nut and bolt between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (e) Secure the left-hand lead:
  - (i) To the bracket (72-53-00/7-40) on the CCOC/exhaust diffuser case flange using the clamp, bushes, spacer, bolt and nut (77-22-03/1-80-90-60-70-50).
  - (ii) To the bracket (72-53-00/7-110) on the CCOC/exhaust diffuser near the junction box using the clamp, bushing halves, pillar bolt and nuts (77-22-03/1-30-40-20-10).
  - (iii) Torque-tighten the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

OVERHAUL

- (f) Torque-tighten the nuts and bolts:
  - (i) Retaining the lead-outs to the mounting plate to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (ii) Retaining the lead-outs terminal block connections at the mounting plate to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (iii) Retaining the thermocouples and junction boxes to the CC0C mounting face to 100 lbf in. (11,5 N.m), align the bolts and keywashers and lock.
  - (iv) Retaining the thermocouple leads to junction box terminal block to between 60 and 65 lbf in. (6,8 and 7,3 N.m).
- (g) Retain the lead-out covers and secure using the washers and nuts, lightly tightened.
- (h) Ensure there is a minimum clearance of 0.500 in. (12,7 mm) between the thermocouple leads and adjacent components and dressing items.
- (5) Install the thermocouple and junction box (77-22-07/1-90) (Pre or SB.77-4 standard), HP compressor rear labyrinth seal (Ref.Fig.515).
  - (a) Position the thermocouple bulb in the union, front lower left CC0C duct (75-02-07/1-10) and the junction box to the mounting plate.
  - (b) Secure the junction box to the mounting plate with the bolts (77-22-07/1-100) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Torque-tighten the thermocouple union nut to the union, to between 220 and 240 lbf in. (25 and 27 N.m) and wire-lock it.
- (6) Install the thermocouple and junction box, intermediate case bearings (77-22-06/1-120) (Pre or SB.77-4 standard) (Ref.Fig.516).

OVERHAUL

- (a) Position the thermocouple bulb in the union of the LP/HP thrust bearing air duct mounted on the lower left centre CCOC and the junction box to the mounting plate.
- (b) Secure the junction box to the mounting plate with the bolts (77-22-06/1-130) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (c) Torque-tighten the thermocouple union nut to the union to between 220 and 240 lbf in. (25 and 27 N.m) and wire-lock it.
- (7) Secure thermocouple leads para.(5) and (6) (Ref. Figs.515 and 516).
- (a) Attach the two lead-outs to the pillar bolt mounted to the rear lug on the centre support tube (72-42-01/1-230). Install the grooved clamps (77-22-06/1-80) to the lead-out and pillar bolt and secure with a nut (77-22-06/1-70).
- (b) Secure the two lead-outs to the drains tank rear mounting bracket.
- (i) Assemble the pillar bolt (77-22-06/1-50) to the anchor nut secured to the drains tank rear mounting bracket (71-73-01/1-150). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (ii) Attach the two lead-outs to the pillar bolt using the grooved clamps and nut (77-22-06/1-60-40).
- (c) Attach the two leads to the lug on the left-hand support tube (72-42-01/1-290) with the grooved clamps, bolt and nut (77-22-06/1-30-20-10).
- (d) Attach the two lead-outs to the fuel heater air valve mounting bracket (73-14-02/1-120) with the grooved clamps, bolt and nut (77-22-06/1-110-100-90).

OVERHAUL

- (e) Attach the lead-out, HP compressor rear labyrinth seal, to the lug on the left-hand labyrinth over-board duct (75-02-07/1-10) with the loop clamp, bushes, bolt and nut (77-22-07/1-70-80-60-50).
- (f) Attach the lead-out, HP compressor rear labyrinth seal, to the bracket (75-02-05/1-110) at the port labyrinth duct (75-02-07/1-10) turbine hot vent pipe joint position, with the loop clamp, bushes, bolt and nut (77-22-07/1-30-40-20-10).

NOTE: Ensure the HP compressor rear labyrinth lead-out is a minimum of 0.25 in. (6,35 mm) clear of the thrust bearing vent sealing face.

- (g) Secure the leads. Torque-tighten all the nuts and bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (h) Ensure there is a minimum clearance of 0.500 in. (12,7 mm) between the thermocouple leads and adjacent components and dressing items.
- (8) Install the jet pipe thermocouple lead-out (77-21-03/1-70) (Ref.Fig.517).

- (a) Position the lead between the mounting plate and the exhaust diffuser.

NOTE: Secure the thermocouple lead rear terminal block to the exhaust diffuser to prevent any damage occurring.

- (b) Secure the forward terminal block to the mounting plate with the bolts (77-21-03/1-80), torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (c) Secure the lead-out to the brackets.
  - (i) (72-53-00/6-280) mounted on the CC0C/ exhaust diffuser flange with the loop clamp, bolt and nut (77-21-03/1-60-50-40).

- (g) Attach the lead to the bracket (73-12-05/1-70) mounted on the fuel sprayer flange with the loop clamp, bushes, bolt and nut (77-22-09/1-30-40-20-10).
  - (h) Torque-tighten the nuts and bolts retaining the loop clamps to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (j) Ensure there is a minimum clearance of 0.500 in. (12,7 mm) between the thermocouple leads and adjacent components and dressing items.
- (10) Assemble the cover (77-22-08/1-10) to the pillar bolts mounted to the plate and attach with nuts (77-22-08/1-20) lightly tightened.
13. Install the Front Bearing Vent Tubes to Overboard Outlet  
(Item 84, Fig.501 of Stage 1)
- A. Prepare for Installation.
- (1) Apply lubricant 'A' to the tube union nut and to the attachment bolts.
- B. Installation (Ref.Fig.519).
- (1) Position the rear tube (75-02-09/1-300) to the engine and engage the rear tube union nut on the connector of the oil tank overboard outlet hand-tight.
  - (2) Assemble the loop clamp (75-02-09/1-260) to the tube, align to the LP and HP compressor thrust bearings scavenge oil thermometer housing (72-01-04/2-60) (Ref. detail A) and retain in position with the bolt, washer and nut (75-02-10/1-130-120-110) lightly tightened.
  - (3) Assemble the loop clamp (75-02-09/1-180) to the tube. Align clamp to the bracket (72-01-04/2-110) mounted near the LP and HP compressor thrust bearing scavenge oil tube flange on the intermediate case sump (pulse probe and drive housing) and attach with bolt, spacer, washer and nut (75-02-09/1-220-210-200-190) lightly tightened.

OVERHAUL

- (4) Position the centre tube (75-02-09/1-170), loosely connect the tube unions to the rear tube and the flanged connector (72-31-01/4-320).
- (5) Assemble the loop clamp (75-02-09/1-100) to the tube and align with the bracket (73-13-01/1-50) mounted on the main fuel feed tube flange. Secure with the bolt, washer and nut, (75-02-09/1-130-120-110) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Assemble two loop clamps (75-02-09/1-10-60) to the tube and align with the brackets (72-31-01/5-300-360) mounted to the LP compressor case rear blow-off flange. Retain with the existing nuts and bolts lightly tightened.
- (7) Torque-tighten the tube union nuts to between 280 and 310 lbf in. (31,6 and 35,0 N.m) (Tools 1648 and 908). Wire-lock the unions.

14. Install the High Energy (HE) Ignition Unit (Item 85, Fig.501 of Stage 1)

A. Preparation for Installation.

- (1) Apply lubricant 'B' to the bolts.
- (2) Record the type and serial number of the HE ignition unit on the accessory sheet.

B. Installation.

- (1) Position the ignition unit (74-11-01/1-10) to the lower left side of the intake case.
- (2) Insert two bolts (74-11-01/1-20) through the ignition units top mounting lugs and assemble the distance pieces (74-11-01/1-30) to the bolt protrusions. Engage the bolts with the attachment locations hand-tight.

OVERHAUL

- PRINTED IN ENGLAND
- (3) With the electrical bonding lead (74-11-01/1-70) assembled to the remaining bolt, insert bolt through lower mounting lug.
  - (4) Assemble the distance piece (74-11-01/1-30-20) to the bolt protrusion and engage the bolt with the attachment location hand-tight.
  - (5) Torque-tighten the bolts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
  - (6) Secure the electrical bonding lead to the stud on the lower end of the ignition unit with washer and nut (74-11-01/1-60-50) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
15. Install the Air Venting Tubes, Starter Break Point to Outlet Seal Plate (Item 86, Fig.501 of Stage 1)
- A. Prepare for Installation.
    - (1) Apply lubricant 'A' to the tube union nuts and attachment bolts.
  - B. Installation (Ref.Fig.520).
    - (1) Position the tube (75-02-10/1-170) to the engine, and screw the rear union nut to the overboard connection.
    - (2) Assemble the loop clamp (75-02-10/1-100) to its location.
      - (a) Assemble the loop clamp to the tube and align with the LP and HP compressor thrust bearings scavenge oil temperature bulb housing (72-01-04/2-60).
      - (b) Attach clamp with the bolt, washer and nut (75-02-10/1-130-120-110) which also retains the loop clamp locating the front bearing vent tube.
      - (c) Lightly tighten the nut and bolt securing the loop clamp.

TUBES AND ACCESSORIES - ASSEMBLY

1. Transfer the Engine from the Vertical Build Stand to the Horizontal Stillage Stand

WARNING: THE LIFTING BEAM MUST BE ADJUSTED TO THE ENGINE BY MEANS OF THE JACKS ON THE BEAM TROLLEY AND NOT ON THE OVERHEAD CRANE.

- A. Assemble and secure the left-hand and right-hand trunnion brackets (Tools 1177 and 1193).
- B. Attach the lifting beam to the trunnion brackets and to the lifting brackets on the intermediate casing/HP casing flange (Tool 1176 beam type sling and front lifting arm).
- C. Attach the lifting sling to the bottom lifting position on the beam. (Tool 1175 beam type sling).
- D. Attach the lifting sling to the top lifting position on the beam (Tool 1174 beam type sling).
- E. Lift the engine from the build ram and turn to the horizontal position.
- F. Lower the engine and position into the mobile engine stand.
  - (1) Secure the trunnion adapters to the pedestal with the pedestal clamps.
  - (2) Assemble the front engine supports to the LP case and secure (Tools 1265 mobile engine stand, 261 mobile engine stand mounting bracket, 808 adapters, right-hand bracket, left-hand bracket, 1314 mobile sling stand).
- G. Remove the engine lifting equipment and store on the mobile stand.

2. Install the LP Compressor Shaft Cover

A. Remove the LP Compressor Support Tool.

- (1) Unscrew the bolts securing the jacking adapter (Tool 319) to the LP compressor shaft.

NOTE: The bolts are retained in the adapter with retaining rings.

- (2) Remove the adapter.

B. Install the LP Compressor Shaft Cover.

- (1) Lubricate the retaining bolts (72-31-03/1-10) with lubricant B.
- (2) Ensure the cover (72-31-03/1-20) is thoroughly clean and undamaged (Pre or SB.72-30 standard).
- (3) Install the cover to the LP compressor shaft.
- (4) Install the bolts.
- (5) Torque-tighten the bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).

3. Check and Adjust Position of LP Shaft Signal System Actuator Arm and Install Rear Insulation Blanket

A. Prepare for Actuator Arm Check and Adjustment.

- (1) Remove the split pin, washer and shoulder pin connecting the signal system rear cable to the centre cable.
- (2) Remove bolts and detach the cover from the rear cover assembly (Ref.Fig.501).

IN16860

OLYMPUS 593

MK.610-14-28 sheema  
OVERHAUL

- B. Establish Required Thickness of Adjusting Washer on Actuator Arm Shaft Stop (Ref.Fig.502).

**CAUTION:** DO NOT SLACKEN NUT SECURING ACTUATOR ARM AND ACTUATOR ARM SHAFT.

- (1) If the original adjusting washer has been assembled to the actuator arm shaft stop (special bolt, 76-21-02/1-490) torque-tighten the nut to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m), then proceed with the check detailed in paragraph (7). Should the check establish that the clearance is incorrect, carry out a full check in accordance with the procedures of the following paragraphs.
- (2) Assemble slave adjusting washer to the actuator arm shaft stop (special bolt, 76-21-02/1-490).
  - (a) Remove the nut and bolt from the bracket lower attachment hole.
  - (b) Slacken the nut and bolt in the bracket upper attachment hole.
  - (c) Turn the bracket to obtain clearance, then remove the nut, adjusting washer and special bolt.
  - (d) Assemble the slave adjusting washer (Tool 234) to the special bolt then locate the bolt in the bracket and retain with the nut lightly tightened.
  - (e) Align the bracket attachment hole and install the retaining nut and bolt, then lightly tighten both retaining nuts.
- (3) Calculate required thickness of adjusting washer.
  - (a) Push the LP rotating assembly fully forward and hold forward while carrying out the following gauge checks.

- (b) Insert the 'GO' section of the extension slip gauge (Tool 30) between the helical splined nut and the end of the actuator arm.
- (c) Apply hand pressure to the actuator arm to ensure that the arm, slip gauge and splined nut are in firm contact, then measure the gap between the stop bolt and the actuator arm shaft. Record as dimension A.
- (d) From the following equation, establish the adjusting washer thickness required.

Washer

thickness = 0.090 in. + dimension A + 0.005 in.  
(2,28 mm) + dimension A + (0,13 mm)

- (4) Remove slave washer from special bolt.
  - (a) Remove the lower retaining bolt from the bracket, slacken the upper bolt and turn the bracket to obtain withdrawal clearance for the special bolt.
  - (b) Remove the nut, special bolt and slave washer.
- (5) Install adjusting washer of correct thickness.
  - (a) From the range available (76-21-02/1-200 to 475) select an adjusting washer that is nearest to the dimension calculated in paragraph (3) and assemble it to the special bolt.

NOTE: If an adjusting washer of specific thickness is not available, a washer of increased thickness may be machined to achieve the desired thickness (Ref. 72-09-21, Repair).

- (b) Assemble the special bolt and selected washer to the bracket and with lubricant B applied, screw the nut to the stop bolt and lightly tighten.

sneema

OVERHAUL

- (c) Align the bracket attachment hole, apply lubricant B and install the retaining bolt and nut, then lightly tighten both retaining nuts.
- (6) Torque-tighten the bracket retaining nuts and the nut assembled to the special bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).
- (7) Check clearance between actuator arm and splined nut.
  - (a) With the LP rotating assembly held fully forward and the actuator arm shaft held firmly against the special bolt, check the clearance between the helical splined nut and actuator arm with the 'GO' and 'NOT GO' sections of the extension slip gauge (Tool 30).
- C. Complete the Assembly Sequence.
  - (1) Connect LP shaft signal system cables.
    - (a) Temporarily connect the rear cable to the centre cable with the shouldered pin, flat washer and split pin (76-21-01/2-370-360-350).
  - (2) Install cover (Ref. Item 87, Fig.501 of Stage 1).
    - (a) Apply jointing compound C to the rear cover attachment flange.
    - (b) With the shoulder pin and its location in alignment, assemble the cover (72-52-03/1-70) to the rear cover and ensure correct engagement of oil transfer block and oil tube (Ref.Fig.501).
    - (c) Retain the cover with twelve bolts (72-52-03/1-60) with lubricant C applied.
    - (d) Torque-tighten the bolts to 100 lbf in. (11,5 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).

- (3) Assemble rear insulation blanket to side blankets  
(Ref. Item 87, Fig.501 of Stage 1).

- (a) On engines to pre SB.72-20 standard, assemble the rear insulation blanket (72-52-03/1-10) over the end cover and secure it to the side blankets with four nuts and bolts (72-52-03/1-20-30) with lubricant 'B' applied. Torque-tighten the bolts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (b) On engines to SB.72-20 standard, assemble the rear insulation blanket (72-52-03/1-10), with the large cut-out in the leading edge positioned at the bottom, over the end cover and align the retaining tabs with those on the side blanket. Secure the retaining tabs with locking wire.

4. Check and Adjust the LP Shaft Signal System

WARNING: WASH HANDS AFTER CONTACT WITH LUBRICANT 'G' ON SIGNAL SYSTEM COMPONENTS. LUBRICANT CONTAINS COPPER AND LEAD AND IS TOXIC.

A. Check and Adjust Cylinder and Piston Assembly (Fig.503).

- (1) Ensure that the engine is cold, and that the valve operating mechanism has been armed.
- (2) Check piston setting.
- (a) Slacken bolt securing strap at front of cylinder, disengage lug and move strap assembly rearwards to expose observation holes of cylinder and piston.
- (b) Check visually through coincident holes of cylinder and piston and note position of indicator groove of catch plate. If observation hole of piston is not coincident with that of cylinder, slacken nut and bolt of sliding guard strap, remove flange retaining bolts and move sliding guard to front end of cylinder and then use turning tool (Tool 1768) to turn piston to required position.

ASSEMBLY

71-00-01

STAGE 6

Page 509

Jan 2/80

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (c) When correctly set, indicator groove of catch plate is in line with rear edge of observation hole in piston.
- (3) Should setting be incorrect, adjust cable and set piston position in relation to catch plate.
  - (a) If not already done, slacken nut and bolt of sliding guard strap, remove flange retaining bolts and move sliding guard to front end of cylinder.
  - (b) Release cable locknut, hold cable and piston against turning, and turn piston nut, held by retaining ring, in the required direction on cable unit threaded end until indicator groove of catch plate is aligned.
  - (c) Apply lubricant B and torque-tighten locknut to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock locknut to piston nut.
  - (d) Recheck and ensure piston setting is correct.
- (4) Move sliding guard rearward to abut flange of fixed guard. Apply lubricant B and secure sliding guard to fixed guard with two nuts and bolts torque-tightened to between 28 and 32 lbf in. (3,2 and 3,6 N.m).
- (5) Apply lubricant B and secure sliding guard clamping strap with nut and bolt torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- B. Check the Quick Shut-down Valve Plunger Mechanism Operation.
  - (1) Check the reset plunger at the fuel distribution and dump valve for free movement (Ref.Fig.504).
    - (a) Check that the reset plunger is free to move sideways in and out of the shroud slot by approximately 0.010 to 0.020 in. (0,25 to 0,50 mm).

- (b) If the movement is not sufficient, slacken the bolts securing the shroud to the distribution and dump valve and turn the shroud the minimum amount to free the plunger and allow the movement to be obtained. Temporarily re-tighten the bolts and check that the reset plunger remains free.
- (2) On engines to Pre S.B.76-26 standard, disconnect centre cable from rear cable.
  - (a) Remove the split pin, washer and shouldered pin securing the centre cable to the rear cable and separate the cable ends.
- (3) On engines to S.B.76-26 standard, disconnect centre cable from rear cable.
  - (a) Remove the nuts and bolts securing the rear block (76-21-01/2-570) to the mounting bracket.
  - (b) Slacken cable at cylinder and piston adjustment and remove rear block.
    - (i) Release the locknut on the piston nut.
    - (ii) Restrain the cable and while holding the piston with the turning tool (Tool 1768) turn the piston nut to slacken the cable and note the exact amount turned. Support the rear block while slackening the cable.
    - (iii) Disengage and remove the rear block without pulling the cable.
  - (c) Reset the cable adjustment to the original position in accordance with the number of turns noted when slackening.
  - (d) Remove the split, washer and shouldered pin securing the centre cable to the rear cable and separate the cable ends.

STAGE 6

Page 512

Jan 2/80

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Assemble the tensioning tool (Tool 1991) to the fork end at the rear of the centre cable.
- (a) Secure the centre cable fork end to the end of the cable in the tensioning tool with a shouldered pin; ensure that the weight of the tool is supported and does not hang on the cable.
  - (b) Attach the spring balance to the tensioning tool, locating it between the cable and the screw.
  - (c) Screw out the tommy bar to take up the slack in the cable, then position the end of the tool against the rear roller block; ensure that the tool aligns with the axis of the centre cable.
- NOTE: If the tensioning tool is not available, the quick shut-down valve plunger mechanism may be checked with a spring balance, taking care that the cable run alignment is maintained.
- (5) Trip the mechanism.
- (a) Observe the spring balance indicator reading and apply a progressively increasing pull on the cable until the reset plunger trips and exposes the red indicator. Ensure that the pull is in line with the cable run axis within a maximum limit of 170 lb (77,1 kg).
  - (b) Record the force indicated when the reset plunger trips (FORCE A).
  - (c) If the plunger mechanism does not trip within the maximum pull limitation, investigate and rectify the defect, then resume the quick shut-down valve plunger mechanism check procedure.

ASSEMBLY

71-00-01

STAGE 6

Page 513

Jan 2/80

OLYMPUS 593

MK.610-14-28

OVERHAUL

(6) Establish the force required to operate the thermal expansion cylinder and piston assembly.

(a) Apply a progressively increasing pull on the centre cable ensuring that the pull is in line with the cable run axis. View through the observation holes and note the force at which the front cable begins to move.

(b) Record the force indicated when the front cable was seen to move (FORCE B).

(7) Calculate the force required to trip the reset plunger (FORCE C).

$$\text{FORCE C} = \text{FORCE A} - \text{FORCE B}$$

Acceptable limits Pre S.B.76-26 standard:

FORCE B = 70 lb (32 kg) (max)  
FORCE C = 50 lb (23 kg) (max)  
or 8 lb (4 kg) (min)

Acceptable limits S.B.76-26 standard:

FORCE B = 56 lb (25 kg) (max)  
FORCE C = 50 lb (23 kg) (max)  
or 8 lb (4 kg) (min)

(8) If the force required to operate the thermal expansion piston (FORCE B) exceeds the maximum limit, reject the piston assembly for re-inspection. If the force required to operate the reset plunger mechanism (FORCE C) is greater than 50 lb (23 kg) re-arm the mechanism and carry out a second pull-off check. If the second check confirms that the force is excessive, renew the distribution and dump valve.

(9) If rectification was necessary, re-arm the mechanism as detailed in paragraph C. and E. and repeat the check procedures detailed in para.(4), (5), (6) and (7).

(10) Check piston setting and secure strap.

- (a) Check visually through coincident holes of cylinder and piston and check that indicator groove of catch plate is in line with rear edge of observation hole in piston.
- (b) If setting is correct, torque-tighten locknut to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock locknut to piston nut.
- (c) If setting is not correct, adjust piston in relation to catch plate as detailed in paragraph A.
- (d) Position cylinder strap to engage lug. Apply lubricant B to clamping screw and torque-tighten to between 28 and 32 lbf in. (3,2 and 3,6 N.m).

C. Arm the Trip Mechanism (Ref.Fig.504).

- (1) Engage the reset tool (Tool 1298) with the recess at the rear of the reset plunger and press it fully in.
- (2) Ensure that the red indicator mark on the reset plunger is not visible.

D. Complete the Assembly.

- (1) Reconnect the cables.
  - (a) Remove the tensioning tool.
  - (b) Align the fork end of the centre cable and the spade end of the rear cable, then pass the attachment tool (Tool 260) through the holes.
  - (c) Assemble the shouldered pin in place of the attachment tool, then assemble the washer and split pin (76-21-01/2-370-360-350).
  - (d) Bend the split pin legs to lock.

ASSEMBLY

71-00-01

STAGE 6

Page 515

- (2) On engines to pre S.B.76-26 standard install rear conduit (Ref.Fig.502 of stage 4).
- (a) Apply lubricant G to the cable and lubricant B to nuts and screws.
  - (b) Position the conduits (76-21-01/2-340) between the rear block and the cable ferrule screwed in the front of the pulley shroud.
  - (c) Secure at the front of the conduit with strap, saddles, nut and screw (76-21-01/2-30-40-10-20), tighten the screw.
  - (d) Secure at the rear of the conduit with strap, saddles, nut and screw (76-21-01/2-320-330-300-310) and tighten the screw.
  - (e) Torque-tighten all the conduit screws to 12 lbf in. (locking/run-down torque 2.0 lbf in. (0,23 N.m)).
- (3) On engines to S.B.76-26 standard install rear conduit (Ref.Fig.503 of stage 4).
- (a) Apply lubricant B to attachment bolts and nuts.
  - (b) Apply lubricant G liberally by brush to the length of the cable where it is in contact with the rear block and guide bush.
  - (c) Slide the rear slotted conduit (76-21-01/2-560) over the cable and connection and, with end compressed, engage fully with centre block bore.
  - (d) Ensure that the matched pair, guide bush halves are correctly installed in the hole in the bracket mounted on the turbine exhaust diffuser case.
  - (e) Simultaneously engage cable with slot of rear block (76-21-01/2-570) and, with conduit end compressed, engage block with conduit end and turn block into position on mounting bracket.

MK.610-14-28  
OVERHAUL

- (f) Align block and bracket attachment holes, insert two bolts (76-21-02/1-30) and secure block to bracket with nuts (1-20) torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (g) Apply lubricant G liberally by brush to the cables where it is in contact with the guide bush and block.
- (h) Turn conduit until slot faces downward.

E. Check that the valve operating mechanism is in the locked position (Ref.Fig.504).

- (1) Remove the nuts and bolts securing the shield front adapter to the shroud.
- (2) Slacken the bolts securing the shroud to the distribution and dump valve.
- (3) Turn the shroud and align the slots.
- (4) Insert the rigging pin (Tool 1990) and press fully home through the alignment holes of the shroud, plunger sleeve, pull off plunger and secondary plunger (Ref.Fig.504). The pin must be fully home so that all axial movement of its sleeve is taken up for the check to be acceptable.
- (5) Remove the rigging pin and turn the shroud to the full extent of slotted flange to close slots then finger-tighten the bolts.

CAUTION: ENSURE THAT CABLE IS NOT PULLED AFTER REMOVAL OF RIGGING PIN. A PULL WILL UNLOCK SECONDARY PLUNGER.

- (6) With lubricant 'A' applied to the retaining nuts and bolts, retain the shield front adapter to the shroud then torque-tighten the nuts to 40 lbf in. (4,5 N.m) (locking/run-down torque 2 lbf in. (0,2 N.m)).

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (7) Check that the reset plunger is free to move sideways in and out of the slot by approximately 0.010 to 0.020 in. (0,25 to 0,50 mm). Progressively tighten the shroud to distribution and dump valve securing bolts to 40 lbf in. (4,5 N.m) (locking/run-down torque 2 lbf in. (0,2 N.m)) ensuring that the reset plunger remains free. If free movement is lost, slacken the bolts, turn the shroud the minimum amount necessary to free the plunger, then re-tighten the bolts; check that plunger is still free.

5. Install the Jet Pipe Thermocouple Harness (Ref. Item 88, Fig.501 of Stage 1)

A. Prepare for Installation.

CAUTION: DO NOT HANDLE THERMOCOUPLE HARNESS WHEN PROTECTOR IS NOT ATTACHED.

- (1) Assemble the protector (Tool 240) to the harness (77-21-02/1-10) while in the container, this provides a handling point (Ref.Fig.505).
  - (a) Remove the quick-release pins from the three pairs of attachment lugs on the round portion of the protector.
  - (b) Unscrew and remove the threaded pin from the bracket plate at the position shown.
  - (c) Hold the protector above the thermocouple, hinge the bracket plate away from the protector body and engage the three pins of the bracket plate with corresponding holes in the flange of the thermocouple junction box.
  - (d) While holding the bracket plate in engagement with the junction box, hinge the protector toward the thermocouple body then engage the attachment lugs and quick-release pins as shown. Note that quick-release pins are retained by floating bushes.

- (e) Engage and tighten the threaded pin at the bracket plate location.

- (2) Apply lubricant C to harness attachment bolts/nuts.

B. Installation (Ref.Fig.506 Sheet 1).

- (1) Remove the cover from the harness lead-out.
- (2) By means of the protector lift the thermocouple through the rear of the exhaust diffuser, then locate the junction box in the aperture in the lower right-hand side of the diffuser.
- (3) Continue to support the thermocouple by means of the protector handle and locate and retain it on the turbine exhaust diffuser inner flange with three bolts (pre S.BB.72-8038-181) or three new nuts (72-8038-181 or 77-9045-35) (77-21-02/1-20) lightly tightened at the 2, 7 and 10 o'clock positions.
- (4) Remove protector from thermocouple.
  - (a) Unscrew and remove the threaded pin from the bracket plate at the position shown.
  - (b) Support the protector and withdraw the quick-release pins securing it to the thermocouple body.
  - (c) Hinge the protector away from the thermocouple body and disengage the bracket plate from the junction box flange.
- (5) Assemble remaining bolts or new nuts (Pre or S.B. 72-8038-181) (77-21-02/1-20) at the exhaust diffuser inner flange location and lightly tighten them.
- (6) Position the harness using the setting bar (Tool 1770) (Ref.Fig.506).
  - (a) Assemble the positioning plate with the adjustment rod retracted to the three pairs of mounting lugs equally spaced on the rear conical shaped face of the harness.

- (b) Secure the plate and rod assembly to the mounts on the thermocouple harness with three pins.
- (c) Extend the adjusting rod until the end piece enters the spherical joint flange boss. Secure the rod with the pin inserted at the rods support housing on the plate.
- (d) Check that the end piece is central in the spherical joint flange boss as shown.
- (e) If necessary move the thermocouple harness on its bolts to centralize the end piece in the boss aperture.
- (f) Hold the thermocouple harness in the required position and torque-tighten the retaining bolts or nuts to 135 lbf in. (15,2 N.m). Locking (Run-down) torque 3.5 lbf in. (0,4 N.m).
- (g) Check the end piece position with the bushing.

NOTE: The bushing has two flats one of which is over dimensioned by 0.06 in. (1,5 mm).

- (i) Align the two bushing flats with those of the end piece and insert the bushing, without force or strain, in the spherical joint flange boss. One bushing flat will contact one of the end piece flats while the other flats must have  $0.06 \pm 0.02$  in. ( $1,5 \pm 0,5$  mm) clearance between them.
- (ii) If the bushing cannot easily be inserted in this position, turn the bushing 180 deg and ensure the dimensions required in (i) are obtained.
- (h) Withdraw the bushing.
- (j) Retract the adjustment rod to allow for the removal of the positioning plate.

- (k) Pull out the three pins and remove the positioning plate.
  - (l) Stow the bushing and pins at their respective locations on the positioning plate.
  - (7) Assemble gasket and outer saddle piece (77-21-02/1-110 and 1-29) over junction box, then assemble thermocouple lead connectors over junction box terminals.
  - (8) Temporarily secure lead terminal block to junction box with two bolts and plain washers (77-21-02/1-24 and 1-25).
  - (9) Insert six bolts (77-21-02/1-40) from the outside surface of the diffuser and secure junction box with nuts (77-21-02/1-30) torque-tightened evenly to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (10) Ensure attachment items are dry and free from lubricant. Assemble a thin washer, lockwasher and nut (77-21-02/1-70, 1-60 and 1-50) to each terminal and torque-tighten nuts to between 30 and 35 lbf in. (3,4 and 4 N.m). Assemble locknut (77-21-02/1-50) to each terminal and torque-tighten to between 30 and 35 lbf in. (3,4 and 4 N.m).
  - (11) Torque-tighten bolts securing thermocouple lead terminal block to junction box to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Wire-lock bolts together.
  - (12) Assemble cover (77-21-02/1-28) to junction box, apply lubricant B and secure cover with two bolts and keywashers (77-21-02/1-26 and 1-27). Torque-tighten bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m) and lock with the keywashers.
6. Install the Reheat Injection System (Ref. Item 89, Fig.501 of Stage 1)
- A. Prepare to Install Injection System.
- (1) Ensure that the jet pipe thermocouple was positioned during its installation (Ref.para.5).

- (2) Install a paraffin wax plug in spray ring pipe elbow if not already plugged (Ref.Fig.507 and 508). A new unit should be supplied already plugged but an overhauled unit would require a plug to be installed.
- (a) Clean the spray ring pipe elbow by introducing a small quantity of a group 1 or 3 solvent (71-09-00 Standard Practices - Assembly) (about 0,30 litre) shake, drain the pipe and dry it using a compressed air supply.
  - (b) Remove holding flange from reheat injection system and position the spray ring on the rest stand as shown.
  - (c) Fill the preheating box with boiling water, to warm up the spray ring pipe elbow.

CAUTION: REJECT WAX IF TEMPERATURE RISES TO MORE THAN 150 DEG C. USE ELECTRIC HEATING DEVICE THAT ENABLES PROGRESSIVE INCREASE IN TEMPERATURE TO BE CONTROLLED.

- (d) Apply heat progressively to 120 grams of paraffin (Total Flexane 3H) wax until it is at an even temperature of between 120 and 130 deg C. Stir wax during the heating phase and ensure that the required temperature is not exceeded.
- (e) Introduce a flexible pouring pipe in the spray ring, pour the melted paraffin wax into the pipe then remove the pouring pipe.
- (f) Withdraw the preheating box from the spray ring bend by driving down the box support. Leave the spray ring in position on the rest stand to cool for at least one hour.
- (g) Carry out a pressure test with compressed air at 6 bar (87 psig) for one minute and check the plug sealing.

(h) Remove spray ring from rest stand.

- (3) Apply lubricant S to the bolts, nuts and pins and lubricant A to the fuel tube and spray ring unions.

B. Install Injection System (Ref.Fig.509).

- (1) If installed, release wingnuts securing holding flange clamp to injector system flame holder and remove holding flange from reheat injection system.
- (2) Locate injection system on thermocouple harness, placing bush, attachment ring and serrated nut (73-12-16/1-120-110-100) in position on elbow end piece as it is progressively inserted through the spherical joint flange, and retain on jet pipe thermocouple with six pins (73-12-06/1-40 and 1-70) inserted through mounts.
- (3) Check that the spray ring end piece does not contact any point of the spherical joint flange boss. If there is contact, centralize the thermocouple harness as detailed in paragraph 5.
- (4) Assemble grooved washers (73-12-06/1-30 and 1-60) to pins at jet pipe thermocouple mounts, lock each pin with a locking pin (73-12-06/1-20-50), bend locking pin leg around washer groove.
- (5) Assemble bush to spray ring.
  - (a) On engines to pre S.B.77-10 and 77-11 standard, position bush on spherical joint flange and retain with five keywashers and bolts (73-12-06/1-90-80) lightly tightened.
  - (b) On engines to S.B.77-10 and 77-11 standard, position bush on spherical joint flange and align pitot tube support bracket and clamp assembly (77-12-03/1-14-8-9). Retain bush and bracket with two bi-hexagon bolts (77-12-03/1-13) at bracket attachment location and hexagon bolts with keywashers (73-12-06/1-80-90) at remaining positions.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (c) Torque-tighten bolts to between 120 and 130 lbf in. (13,6 and 14,7 N.m). Tighten bolts progressively in sequence to evenly dispose the load over the joint surface.
- (d) On engines to pre S.B.77-10 and 77-11 standard, lock bolts with keywashers.
- (e) On engines to S.B.77-10 and 77-11 standard, lock hexagon bolts with keywashers. Wire-lock bi-hexagon bolts together. Torque-tighten clamp assembly bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (6) Secure spray ring elbow end piece to spherical joint flange.
  - (a) Position attachment ring on bush (73-12-06/1-110-120) and ensure that plate is located on bush dowel.
  - (b) Apply lubricant S to serrated nut threads and screw nut onto threads of elbow end piece.
  - (c) Torque-tighten nut to between 510 and 550 lbf in. (57 and 63 N.m).
- (7) Check that the spray ring moves freely.
- (8) Check that the clearance between the spray ring curved feed tube and the nearest pair of link rods is not less than 0.118 in. (3 mm).
- (9) Lock the serrated nut to attachment ring with wire.
- (10) Remove blanking plugs from spray ring elbow end piece and the reheat fuel supply tube.
- (11) Connect the reheat fuel supply tube (73-13-03/2-240) to the reheat spray ring.
  - (a) Screw tube union nut to spray ring elbow connection by hand until the visible part of the thread is less than 0.10 in. (2,5 mm).

JN4058

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (b) Restrain elbow end piece with spanner, torque-tighten slotted union nut between 780 and 840 lbf in. (88 and 95 N.m) (Tools 1658, 948 and 1529).
- (c) Lock nut with wire.
- (d) Paint a continuous line with heat resistant paint on the elbow end piece, slotted union nut and reheat fuel supply pipe.

NOTE: The line must be positioned to be visible from the underside of an engine when installed.

## 7. Fuel System Pressure Test

### A. General.

Engines are pressure tested using a test rig. A final pressure check of the connections is carried out using the test cell fuel feed pumps.

A low pressure test must precede both the medium and high pressure tests.

For convenience the fuel system is considered in three sections (Ref.Fig.510):

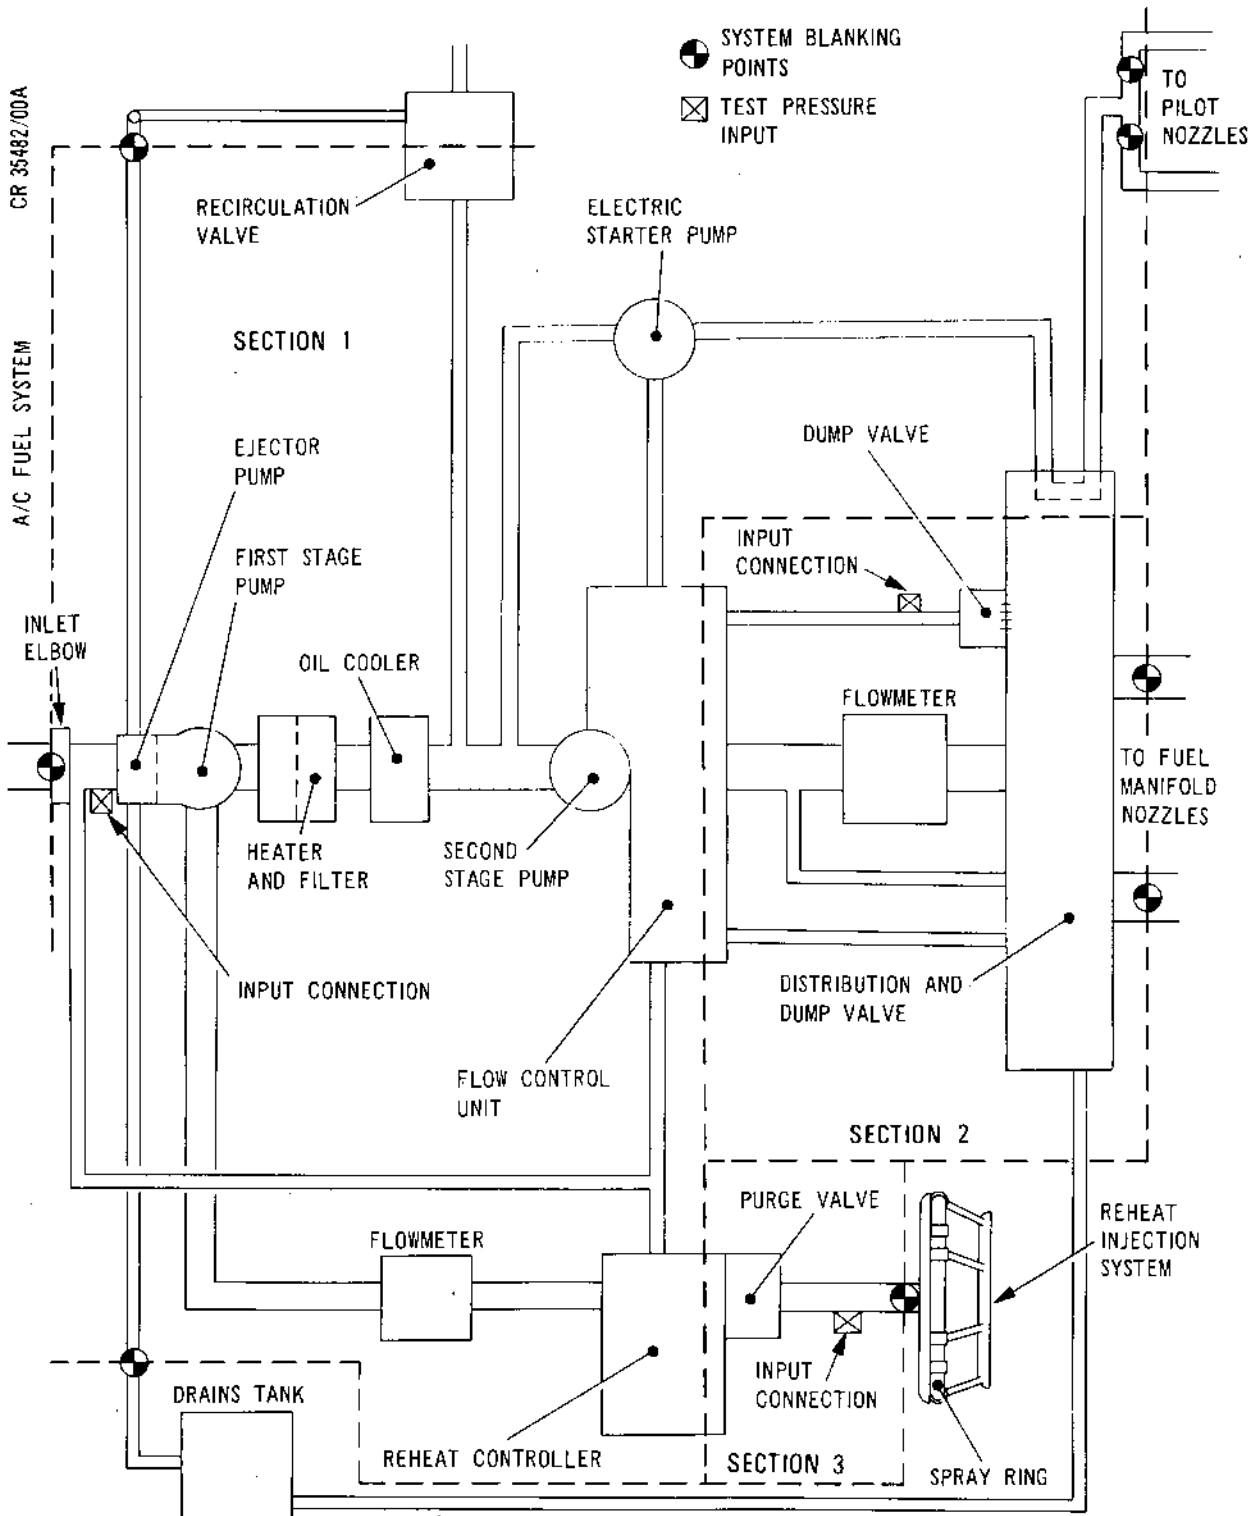

- (1) Upstream of the FCU and reheat controller shut-off valves, can be tested separately.
- (2) Upstream of the reheat controller shut-off valve and distribution and dump valve.

NOTE: Section 1 must be pressurized for a test of Section 2 and can be checked at the same time as this applied pressure is effective downstream of the fuel inlet elbow blank and recirculation valve.

- (3) Downstream of the reheat controller to spray ring elbow, can be tested separately.

C. Prepare for Test.

- (1) Verify that the reheat fuel spray ring elbow is blanked with a wax plug (Ref. Para.6).

D. Install Test Equipment (Ref.511, Sheet 1 and 2).

CAUTION: ENSURE TEST EQUIPMENT IS CLEAN AND SERVICEABLE BEFORE INSTALLING ON ENGINE.

- (1) Install pressure test blank and clamp (Tool 3106 and 3109) in the fuel inlet elbow (Ref.Fig.511, detail A).
  - (a) Remove the protective blank from the inlet elbow.
  - (b) Detach protective cover, ensure blank unit sealing ring is serviceable and press unit into fuel inlet elbow bore.
  - (c) Position clamp over blank and elbow flanges and tighten securely.
- (2) Assemble hose and adapter (Tool 3113 and 3103 or 3104) to fuel inlet elbow drain valve location (Ref. Fig.511, detail A).
  - (a) Pre S.B.73-1 drain valve - install adapter (Tool 3103).
    - (i) Remove attachment bolts and detach drain valve.
    - (ii) Insert a serviceable seal plate and secure adapter to elbow at valve location with three bolts torque-tightened to between 67 and 73 lbf in. (7,6 and 8,2 N.m) with lubricant B applied.

- (b) S.B.73-1 drain valve - install adapter (Tool 3104).
  - (i) Screw adapter securely into drain valve. This action opens the valve.
- (c) Connect hose (Tool 3113) to installed adapter, tighten securely and support hose with strap.
- (3) Install the drain adapter and blanking plug (Tool 3117 and 3116) in return fuel tube, drains tank to first stage pump/recirculation valve at inlet and outlet to ejector pump/first stage pump (Ref.Fig.511, detail E).
  - (a) Disconnect fuel tube from ejector pump inlet and assemble drain adapter to pump connection. Tighten adapter union nut.
  - (b) Remove blanking ferrule from return tube test connection, insert blanking plug and retain with connection union nut firmly tightened.
- (4) Install the throttle valve actuator gearbox spill/drain adapter (Tool 3110) in the actuator casing (Ref.Fig.511, detail B). During this operation, keep fluid loss to a minimum so that the actuator remains primed.
  - (a) Remove drain plug from actuator gearbox rear face.
  - (b) Remove drain tube from adapter, install adapter with seal washer and tighten firmly.
  - (c) Assemble drain tube to adapter with seal washer interposed.
- (5) Assemble drain adapter (Tool 3118) to fuel inlet elbow drain connection (Ref.Fig.511, detail A).
  - (a) On engines to Pre S.B. OL.593-71-10 standard, remove seal failure drains system fluid passage pillar bolt and detach connector complete with drain tubes.

- (b) On engines to S.B. OL.593-71-10 standard, detach seal failure drains tube from fluid passage bolt, remove the bolt and detach connector complete with drain tube.
- (c) Assemble a serviceable seal washer to the adapter and install it in the drain outlet connection.
- (6) Install one of the fuel atomizing pilot nozzle tube blanks (Tool 3108) and the drain adapter (Tool 3119) ready for the low pressure test (Ref.Fig.511, detail F).
- (a) Detach the two fuel atomizing pilot nozzle tubes from the junction of the tube from distribution block/dump valve.
- (b) Detach clamp assembly securing left-hand tube to support bracket to give clearance when installing adapter.
- (c) Screw blank and drain adapter on the tube junction connections and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,7 N.m) with lubricant A applied.
- (7) Install the drain adapter (Tool 3111) in the first stage pump gland drain connection (Ref.Fig.511, detail E).
- (a) Remove fluid passage bolt from drain connector.
- (b) Assemble a serviceable seal washer to each side of connector and secure to pump with adapter torque-tightened between 210 and 230 lbf in. (23,7 and 26 N.m) with lubricant applied.

NOTE: Adapter isolates first stage pump gland drain from engine drains tube and provides test drain tube.

- (8) Install the drain adapter (Tool 3120) on the second stage pump (fuel/air) drain outlet (Ref.Fig.511, detail G).
- (a) Unscrew union nuts and disconnect the two drain tubes from the flanged elbow.
  - (b) Remove bolts and detach flanged elbow.
  - (c) With a serviceable seal plate (71-73-03/1-90) between faces, secure drain adapter to pump with four bolts torque-tightened between 67 73 lbf in. (7,6 and 8,2 N.m) with lubricant B applied.
  - (d) Connect first stage pump and FCU gland drain tube to union connection on drain adapter and tighten union nut firmly.

NOTE: Adapter changes common drains passage of flanged elbow to two separate drain outlets to test drain tubes.

- (9) Connect hose (Tool 3112) to connection on servo fuel tube near connection to distribution and dump valve (Ref.Fig.512).
- (a) Remove blanking ferrule from tube flange.
  - (b) Engage hook of hose support as shown and adjust the strap so that the hose is supported clear of engine installations.
  - (c) Attach hose adapter to connection and torque-tighten union nut between 190 and 210 lbf in. (21,5 and 23,5 N.m) with lubricant applied.
- (10) Install blanking unit and blanking/bleed valve (Tool 3107 and 3122) in the fuel outlet connections of distribution and dump valve (Ref.Fig.512).
- (a) Remove both manifold fuel tube connection blanking ferrules.

- (b) Install blanking units in place of the ferrules.
  - (c) Secure each unit in position torque-tightened between 600 and 660 lbf in. (68 and 74 N.m) with lubricant A applied.
- (11) Install drain adapter (Tool 3121) in distribution and dump valve dump outlet (Ref.Fig.512).
- (a) Remove nut, bolt and flat washer securing tube clamp assembly and electrical lead clamp to support bracket at diffuser case flange.
  - (b) Remove bolts securing tube flange at distribution and dump valve and detach bracket.
  - (c) Support tube and unscrew tube union nut at drains tank.
  - (d) Detach tube end connections and move drain tube to obtain access.
  - (e) Ensure the sealing ring and flat seal are serviceable, assemble adapter to the dump outlet location and secure with three bolts torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m) with lubricant A applied.
- (12) Detach purge air tube from purge solenoid valve outlet connection and assemble adapter (Tool 3101) in tube end (Ref.Fig.513, detail C).
- (a) Disconnect tube from the purge solenoid valve outlet connection.
  - (b) Attach adapter to tube end and torque-tighten union nut to between 190 and 210 lbf in. (21,5 and 23,7 N.m) with lubricant A applied.

OVERHAUL

- (13) Assemble blank in purge air/fuel tube connector between reheat purge valve and spherical joint flange (Ref.Fig.513, detail B).
  - (a) Disconnect the purge air/fuel tube sections at the junction between reheat purge valve and spherical joint flange.
  - (b) Install blank in end of tube section connected to purge valve and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,7 N.m) with lubricant A applied.
- (14) Disconnection of the seal failure drains system tubes at the following positions will provide a more precise check for leaks (Ref.Fig.514).
  - (a) Reheat fuel filter drain outlet connection.
  - (b) The two flexible tubes at connector at reheat flowmeter bracket.
  - (c) Aircraft drain tube connection.
- (15) Direct free ends of tubes into a container.

E. Pressure Test Procedure, Full System.

- (1) Comply with the following general procedure for a pressure test.
  - (a) Prepare and use the PTIR for the test sequence to be employed in accordance with its general procedure and safety precautions.
  - (b) Couple the two self-sealing hoses of the test rig to the installed test adapter hoses at the inlet elbow and the servo fuel tube.
  - (c) Connect third test rig delivery hose to the test adapter at the purge air tube and tighten the union nut.

- (d) Verify that the weight of each hose is supported and that all connections are secure before commencing test procedure.
  - (e) Apply pressure slowly and progressively during the test procedure and maintain constant observation for signs of fuel leaks from test equipment or engine fuel system. Should a leak develop, reduce the pressure to zero and stop the pump motor, rectify the fault and re-commence the test procedure.
- (2) Bleed all air from the system and continue with the low pressure test (Ref. para. (3)).
- (a) Operate the test rig and apply a pressure of 30 psig (207 kPa).
  - (b) Section 1 - Open the air bleed valve and bleed until an air free fuel flow is obtained and then close the valve. Allow a short settling period and repeat the bleed process to ensure that the second stage pump region is air free and again close the valve.
  - (c) Section 2 - open bleed valve of manifold blank/ bleed valve and allow to bleed until an air free flow is again obtained and then close bleed valve.
- (3) Carry out the low pressure test of all sections.
- (a) With 30 psig (207 kPa) pressure applied, check leakage rates from the pilot sprayer system, via pilot sprayer fuel tube, and from the ejector pump inlet. Measure leakage from drain adapters. The maximum acceptable leakage rates are as follows:
    - (i) Pilot sprayer tube ... 5 cc/h
    - (ii) Ejector pump inlet ... 1 cc/min

OVERHAUL

(b) Continue to apply pressure at 30 psig (207 kPa) and complete the low pressure test. Check drains for indication of seal leakage and ensure that the following conditions are met before commencing the high pressure test.

(i) Gland seal leakage should be minimal. Compare with high pressure test limits as a guide (Ref. para. (5) (d)).

(ii) No leakage from the primary static seals is acceptable. If a leak shows from the seal failure drains system, carry out progressive disconnections of drains system and find defective seal(s) by a process of elimination and reference to the relevant component chapter.

NOTE: A leak from the fuel inlet elbow drain could be indicative of a defective seal in the inlet elbow blank.

(iii) There should be no spill from the throttle actuator gearbox rear face drain adapter since the relief valve setting of the adapter is higher than the applied pressure.

(iv) Check system from reheat controller to spray ring. No leakage is acceptable.

(c) Blank pilot sprayer fuel tube for further pressure test.

(i) Remove drain adapter and install blanking unit torque-tightened between 190 and 210 lbf in. (21,5 and 23,5 N.m) with lubricant A applied.

(4) Carry out a medium pressure test of the reheat system.

(a) Operate the test rig and increase the test pressure to 170 psig (1172 kPa).

ASSEMBLY

71-00-01

STAGE 6

Page 547

OVERHAUL

- (b) Apply pressure for at least five minute and carry out a general external visual examination of the system while continuing to apply pressure. No leaks are acceptable.
  - (c) Reduce test pressure to zero.
  - (d) On satisfactory completion of reheat system test, disconnect test rig supply hose from adapter and test rig manifold coupling. Ensure that test rig coupling seals off the rig delivery.
- (5) When test rig is disconnected from the reheat system, Section 3, continue with a high pressure test of the engine system.
- (a) Operate the test rig and increase the test pressure to 600 psig (4137 kPa).
  - (b) Apply pressure for at least five minutes and carry out a general external visual examination of the system while continuing to apply pressure. No leaks are acceptable.
  - (c) Continue to apply pressure and check component seal failure drain connections for signs of leaks. No leaks are acceptable. If a leak is disclosed, carry out progressive disconnections and find defective seal(s) by a process of elimination and reference to the relevant component chapter.

NOTE: A seal drains connection at a component may be interconnected internally to more than one seal.

TN43311

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (d) Maintain the pressure long enough to measure accurately leakage from the installed drain adapters. Use a graduated measuring jar and stop watch. The acceptable limits are as follows:
- |       |   |     |     |            |
|-------|---|-----|-----|------------|
| (i)   | First stage pump  | ... | ... | 10 cc/min  |
| (ii)  | Second stage pump<br>(fuel/air drain)                         | ... | ... | 10 cc/min  |
| (iii) | FCU gland drain   | ... | ... | 10 cc/min  |
| (iv)  | Throttle valve spill (actuator<br>gearbox rear face drain) .. |     |     | 100 cc/min |
| (v)   | Quick shut-down (emergency<br>dump) valve...                  | ... | ... | 20 cc/min  |
| (vi)  | Manifold (normal) dump<br>valve...                            | ... | ... | 10 cc/min  |
| (vii) | Ejector pump inlet  | ... | ... | 10 cc/min  |
- (e) Reduce test pressure to zero and stop pump motor.
- (6) On completion of a satisfactory pressure test, drain the fuel system using the test rig facilities and then uncouple the delivery hoses. Open the bleed valves to expedite draining.

CAUTION: ENSURE THAT AIR BLEED TUBE IS NOT  
INSTALLED. FOREIGN PARTICLES COULD  
BE DRAWN INTO ENGINE FUEL SYSTEM.

- (7) Inhibit the engine at this stage if required.

F. Remove Test Equipment and Install/Connect Engine Components.

- (1) Remove inlet connection blank and clamp ring. Assemble the transit blank to the inlet connection aperture (Ref.Fig.511, detail A).

ASSEMBLY

71-00-01

STAGE 6

- (2) Remove hose and adapter and install drain valve (Ref.Fig.511, detail A).
  - (a) Unscrew union nut and disconnect hose from adapter at inlet elbow drain valve position, release support strap and remove hose from engine.
  - (b) Pre S.B. OL.593-73-1 drain valve - remove adapter and install drain valve.
    - (i) Remove bolts and take off adapter and seal plate.
    - (ii) Apply lubricant B to drain valve attachment bolts.
    - (iii) Assemble drain valve and serviceable seal plate (Ref.70-00-03, Sealing Devices) to inlet elbow location and retain in position with three bolts. Secure wire-locking washer, attached to pressure cap chain with outer bolt.
    - (iv) Torque-tighten the three bolts to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) S.B. OL.593-73-1 drain valve - remove adapter.
    - (i) Unscrew union nut and remove adapter from valve.
- (3) Remove adapter and plug, connect tube and install the blanking ferrule at ejector pump (Ref.Fig.511, detail E).
  - (a) Remove plug and assemble blanking ferrule and union nut to connection on return fuel tube and torque-tighten between 220 and 240 lbf in. (25 and 27 N.m) with lubricant A applied.
  - (b) Remove adapter and connect fuel tube to ejector pump inlet and torque-tighten union nut between 220 and 240 lbf in. (25 and 27 N.m) with lubricant A applied.
  - (c) Wire-lock both union nuts.

- (4) Remove adapter (Ref.Fig.511, detail B) and install the blanking plug with a new seal washer in the throttle actuator gearbox rear face location. Torque-tighten plug to  $47 \pm 3$  lbf in. ( $5,3 \pm 0,3$  N.m) and wire-lock it. During this operation, keep fluid loss to a minimum to keep actuator gearbox primed.
- (5) Remove blanks (Ref.Fig.511, detail F) and connect the pilot sprayer fuel tubes to the tube junction.
- (a) Remove blanks from fuel atomizing pilot nozzle tube junction.
  - (b) Apply lubricant A to tube union connections and lubricant B to clamp assembly bolt and nut.
  - (c) Screw tube union nuts to junction and torque-tighten to between 190 and 210 lbf in. (21,5 and 23,5 N.m).
  - (d) Secure clamp assembly to support bracket with bolt, flat washer and nut torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N,m).
  - (e) Wire-lock union nuts.
- (6) Remove the drain adapter from the fuel inlet elbow (Ref.Fig.511, detail A) and connect seal failure drains system.
- (a) Apply lubricant A to attachment items.
  - (b) Assemble a new seal washer to each side of the connector, secure in position with the fluid passage bolt and torque-tighten to between 150 and 170 lbf in. (17 and 19,2 N.m).
  - (c) On engines to S.B. OL.593-71-10 standard, connect seal drain tube to fluid passage bolt and triple torque-tighten thrust wire type union nut (Ref.70-00-04, Torque-tightening Technique) to between 90 and 100 lbf in. (10,2 and 11,5 N.m).
  - (d) Wire-lock bolt and union nuts.

- (7) Remove the drain adapter at the first stage pump (Ref.Fig.511, detail E). Assemble a new seal washer to each side of drain tube connector and secure to pump with the fluid passage bolt torque-tightened between 210 and 230 lbf in. (24 and 26 N.m) with lubricant A applied. Wire-lock bolt.
- (8) Remove the drain adapter from the second stage pump, install flanged elbow and connect drain tubes (Ref. Fig.511, detail G).
  - (a) Apply lubricant to union nuts and bolts.
  - (b) With a new seal plate between mating faces, secure flanged elbow to pump with four bolts torque-tightened between 67 and 73 lbf in. (7,6 and 8,2 N.m).
  - (c) Secure tube to drains tank to flanged elbow connection with union nut torque-tightened between 600 and 660 lbf in. (68 and 74 N.m).
  - (d) Secure tube from first stage pump and FCU to flanged elbow with union nut torque-tightened between 190 and 210 lbf in. (21,5 and 23,5 N.m).
  - (e) Wire-lock union nuts.
- (9) Detach hose adapter (Ref.Fig.512) and install the blanking ferrule to connection on servo fuel tube near connection to distribution and dump valve.
  - (a) Assemble blanking ferrule to connection and torque-tighten union nut between 190 and 210 lbf in. (21,5 and 23,5 N.m) with lubricant applied.
  - (b) Wire-lock union nut.
- (10) Remove test blanking units and install flight standard blanking ferrules in tube connections (Ref.Fig.512).
  - (a) Assemble a blanking ferrule to each of the two tube connections at the distribution and dump valve and torque-tighten the union nuts between 600 and 660 lbf in. (68 and 74 N.m) with lubricant applied.

(b) Wire-lock union nuts.

(11) Remove the drain adapter and connect the fuel dump drain tube (Ref.Fig.512).

(a) Remove drain adapter. Ensure that flat seal remains attached to adapter.

(b) Assemble a new sealing ring to the spigot groove of attachment flange.

(c) Apply lubricant A to tube flange bolts and union connection.

(d) Position the tube and engage the spigot squarely with dump outlet of distribution and dump valve and screw union nut on drains tank union hand-tight.

(e) Secure the flange, together with the support bracket, to the dump outlet with the three bolts lightly tightened. Locate the two longer bolts to retain bracket.

NOTE: If difficulty is experienced in assembling and securing flange to distribution and dump valve, refer to S.B. OL.593-71-8482-20.

(f) Secure tube clamp assembly and electrical lead clamp to bracket at diffuser case flange with bolt, flat washer and nut. Torque-tighten nut to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(g) Torque-tighten the tube flange retaining bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m) and union nut to between 310 and 340 lbf in. (35 and 38 N.m).

(h) Wire-lock union nut.

(c) Wire-lock union nut.

NOTE: Wax plug in reheat injection system spray ring will be dispersed when engine is run.

- (15) Assemble pressure caps with new seals to the heater and filter unit and the fuel inlet elbow drain valves. Tighten and wire-lock the caps.
- (16) Close and torque-tighten the air bleed valve between 100 and 110 lbf in. (11,3 and 12,4 N.m). Remove bleed tube and blank, fit dust cap to valve and wire-lock.

8. Install Reheat Flame Detector (Item 90, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant S to the four flame detector attachment bolts (76-15-02/1-90 and 77-12-03/1-153) and lubricant B to remaining nuts and bolts.
- (2) Record the type and serial number of the detector on the accessories sheet.

B. Installation (Ref.Fig.515).

CAUTION: TAKE CARE NOT TO BEND REHEAT FLAME DETECTOR CONDUCTOR AT ANY TIME. BENDING COULD RESULT IN DETERIORATION OF CONDUCTOR INSULATION.

- (1) On engines to pre S.B.77-10 and 77-11 standard, assemble detector (76-15-02/1-80) to spherical joint flange and retain with four bolts (76-15-02/1-90) lightly tightened.
- (2) On engines to S.B.77-10 and 77-11 standard, assemble detector (76-15-02/1-80) to spherical joint flange, align pitot tube clamp and support bracket (77-12-03/1-154) to flange and insert bolts (77-12-03/1-153) to retain bracket. Insert bolts (76-15-02/1-90) in remaining two holes and then lightly tighten all four bolts.

- (3) Torque-tighten bolts (Pre or S.B.77-10 and 77-11 standard) to  $105 \pm 18$  lbf in. ( $12 \pm 2$  N.m). Wire-lock bolts in pairs.
- (4) Torque-tighten pitot tube clamp bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Assemble the detector bracket to the bracket on the CCOC/exhaust diffuser flange and retain with bolts and nuts (76-15-02/1-110-100). Torque-tighten the nuts and bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (6) Attach the loop clamp (76-15-02/1-10).
  - (a) Assemble loop clamp to the probe and align with the bracket (72-53-00/2-110) on the elbow at vane seven of the exhaust diffuser case.
  - (b) Secure with bolt, washer and nut (76-15-02/1-40-30-20).
  - (c) Torque-tighten the nut and bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Ensure that the gap measured between the reheat flame detector and the nearest point on the trailing edge of the flame holder is within the acceptable limit of  $2.36 \text{ in.} \pm 0.71 \text{ in.}$  ( $60 \text{ mm} \pm 18 \text{ mm}$ ).

9. Install Reheat Igniter (Ref. Item 91, Fig.501 of Stage 1)

A. Prepare for Installation.

CAUTION: UNDER NO CIRCUMSTANCES MUST THE CABLE BE DISCONNECTED FROM THE IGNITER PLUG BODY.

- (1) Apply lubricant S to the bolts.
- (2) Record the type and serial number of the igniter on the accessories sheet.

B. Installation (Ref.Fig.516).

- (1) Position the shim on the igniter (74-22-01/1-35-10).
- (2) Position the igniter in its location and insert the igniter through the spherical joint flange. Carefully engage the end piece in the reheat fuel injection system (73-12-06/1-10) prechamber aperture, push fully into engagement and if any resistance is felt, withdraw igniter and align aperture.

CAUTION: ENSURE THAT THE END PIECE OF THE REHEAT IGNITER IS CORRECTLY ENGAGED IN THE PRECHAMBER APERTURE.

- (3) Hold the mating faces in abutment with the air connection in alignment for connection to the air supply pipe and secure igniter to spherical joint with five bolts and keywashers (74-22-01/1-20-30) torque-tightened to between 10 and 14 N.m (90 and 120 lbf in.).
- (4) Lock the bolts with the keywashers.
- (5) On engines to S.B.74-3 standard, assemble the clamp to the igniter lead, secure clamp to support (74-22-01/1-17) with nut and bolt (74-22-01/1-14-17-13-15) lightly tightened. Loosely assemble nut and bolt (74-22-01/1-16-18) to support for attachment of support to ignition transformer bracket.

10. Install the LP Rotor Shaft Bearing Housing Cover (Item 92, Fig.501 of Stage 1)

A. Prepare for Installation.

- (1) Apply lubricant B to the bolts.

B. Installation (Ref.Fig.517).

- (1) Front bearing housing cover.

NOTE: Ensure the headless shoulder pin (72-23-01/1-70) is assembled to the bearing housing front flange.

### TUBES AND ACCESSORIES - ASSEMBLY

1. Install the Vibration Transducer on the LP Compressor Bearing Cover (Ref. Item 93, Fig.501 of Stage 1)

NOTE: The LP compressor bearing vibration transducer is required for engine testing purposes only.

A. Prepare for Installation.

- (1) Apply lubricant 'B' to the attachment nuts and bolts.
- (2) Record the type and serial number of the transducer on the accessory sheet.

B. Installation (Ref.Fig.501).

- (1) Position the vibration transducer (77-33-02/1-10) on the front bearing cover mounting.
- (2) Secure the transducer with bolts and nuts (77-33-02/1-30-40-20) torque-tightened to between 11 and 13 lbf in. (1,2 and 1,4 N.m), locking (run-down) torque 1 lbf in. (0,12 N.m).

2. Assemble/Install and Test Engine Vibration Transducer Cable

A. Prepare for Installation.

- (1) Ensure transducer connector is assembled to cable (Ref.77-33-01, Assembly).
- (2) Apply lubricant 'B' (Ref.71-09-00, Table 501) to all nuts and bolts except where specific requirement is stated.

B. Assemble Cable to Intake Case (Ref.Fig.501).

- (1) Locate cable (77-33-01/1-200) complete with transducer connector in its installed position on engine.
  - (a) Enter free end of cable and feed through vane No.3 until end passes externally through the flange assembly.

- (b) Ensure that a serviceable sealing ring (77-33-01/1-230) is in position on the connector and engage it with the transducer receptacle hand-tight. Finally tighten and secure the connector when the wall mounted receptacle is attached to the cable and electrical checks are carried out (Ref.para.B).
- (2) Retain cable in the installed position.
- (a) Wrap glass cloth tape (Symel SP 1697) round cable at location registering with support bracket (72-23-01/1-20), assemble loop clamp over wrapping and secure clamp to bracket with bolt and nut (77-33-01/1-50-40) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Ensure cable is not kinked or stretched.
- (b) Prepare gland packing. Impregnate silica fibre cord with Wellseal solution.
- (c) Secure cable at flange assembly with inner gland, packing and outer gland (77-33-01/1-110-100) as shown in Figure 501. Position bracket (77-33-01/1-90) on outer gland flange and secure glands and bracket with bolts (77-33-01/1-80) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (d) Cut cable to a length of 12 to 13 in. (305 to 330 mm) from face of gland assembly.
- (e) Assemble loop clamp (77-33-01/1-30) to the cable and secure to the bracket (77-33-01/1-90) with nut and bolt (77-33-01/1-10-20) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Ensure that the cable is not kinked or stretched, the loops are smooth and the cable is positioned to obviate chafing.

OVERHAUL

B. Assemble Wall Mounting Receptacle to Cable End (Ref. Fig.502).

- (1) On engines to Pre SB.77-8661-28 standard, prepare cable end for attachment of contacts.
  - (a) Assemble tape marker (1-190) to cable (1-200) and retain with clip (1-193).
  - (b) Slide plug end bell, telescopic bushes (1-183 and 1-184) and solder sleeve (1-188) over cable and clear of cable end.
  - (c) Remove outer sheath for a distance of 45,0 mm from end of cable (Detail A). Avoid damaging screen braid.
  - (d) Remove screen braid to 12,0 mm from end of outer sheath (Detail A).
  - (e) Comb out screen braid, fold back over outer sheath and trim to 6,0 mm (Detail B). Trim off fillers to fold edge.
  - (f) Assemble an inner sleeve to each core (Detail B).
    - (i) Position a sleeve (1-195) on each core in abutment with the screen braid.

- (ii) Set thermo-gun (Tool 2603) with reflector (Tool 2605) attached, to give a minimum temperature of 380°C. Switch on and allow to heat for 5 minutes to reach required temperature.
- (iii) Direct air all round sleeve until sleeve becomes transparent and shrinks to grip the core and then remove the heat source and allow sleeve to cool. Heat application may be from 8 to 20 seconds but should not exceed 50 seconds.
- (iv) Check visually that there are no splits in the sleeves and that there are no signs of heat damage.
- (g) Assemble an outer sleeve (1-197) on each core in abutment with screen braid and covering the inner sleeve. Heat shrink as detailed in para. (f) (i) to (iv) (Detail B).
- (h) Position a cover sleeve (1-199) centrally over back fold of screen braid (Detail C) and heat shrink as detailed in para. (f) (i) to (iv).
- (j) Assemble earthing tail to cable end.
  - (i) Remove outer sheath and expose braid for a distance of 8 to 12,5 mm with the exposed edge 12,7 mm from the edge of the outer sleeve (Detail C). Avoid damaging screen braid.
  - (ii) Remove insulation from earthing tail and expose conductor for a distance of 7,0 to 8,0 mm (Detail D).
  - (iii) Comb out wires of conductor to a fan shape, form them over the exposed braid and apply flux B (Ref.71-09-00 Table 501) to braid and wires.

OVERHAUL

- (d) Using firm even pressure, press tool against contact shoulder and insert contact and tool into insulator until retaining tines snap into place behind contact shoulder.
- (e) Withdraw tool from insulator, lightly pull core to ensure contact is properly seated.
- (4) When contacts are inserted, assemble plug end bell to plug body and hand-tighten.
- (5) Position the telescopic bushes (1-183 and 1-184) on to the cable (Fig.504). Secure with plug clamp bar(s) by tightening the two screws with screwdriver (Tool 2606) until adequate grip is provided on the telescopic bushes and no gap is visible between the clamps.
- (6) Wire-lock screws to plug end bell and end bell to plug body.

C. Check Cable Length.

- (1) Check cable length (Ref.Fig.505). With the wall mounting receptacle assembled to the cable end, ensure the dimension from the face of the gland (1-100) to the face of receptacle is between 304 and 330 mm.
- (2) If the dimension is less than 304 mm, remove the cable and assemble a new cable (Ref.77-33-01, Assembly).

D. Check Completed Cable Assembly for Continuity.

- (1) Unscrew connector from transducer.
- (2) Assemble dummy plug, with a shorting link between contacts A and B, to wall mounting receptacle at intake/compressor case.
- (3) Carry out a continuity check between socket contacts 1 and 2 at transducer end of cable.
- (4) Remove dummy plug.

OVERHAUL

E. Check Transducer Cable Insulation Resistance at Wall Mounting Receptacle.

- (1) Check resistance between contacts A, B and C in turn.
- (2) Check resistance between contact C and body of transducer connector.
- (3) A resistance of less than 20 megohms is not acceptable for these checks.

F. Connect Transducer Cable Connector.

- (1) On engines to Pre SB.77-8611-26 standard, assemble connector as follows:
  - (a) With a new sealing ring (1-230) against shoulder of transducer connector end, assemble connector dry and free from lubricant, to receptacle and hand-tighten.
  - (b) Torque-tighten connector nut to between 60 and 100 lbf in. (6,8 and 11,3 N.m) until castellations of nut align with those of adjacent nut. Engage locking clip (1-220) with castellations. Wire-lock clip ends together.
- (2) On engines to SB.77-8611-26 standard, assemble connector as follows:
  - (a) With a new sealing ring (1-300) against shoulder of transducer connector end, assemble connector dry and free from lubricant, to receptacle and hand-tighten.
  - (b) Torque-tighten connector nut to between 60 and 100 lbf in. (6,8 and 11,3 N.m). Wire-lock connector nut.

G. Secure Wall Mounting Receptacle to Bracket.

- (1) Ensure that sealing ring (1-181) is installed correctly.
- (2) Secure the receptacle to the mounting bracket with four nuts (1-130) and screws (1-140). Torque-tighten to between 8 and 10 lbf in. (0,9 and 1,1 N.m).

3. Install the Air Intake Fairing and Damper Spring  
(Ref.Item 94, Fig.501 of Stage 1)

A. Installation of Damper Spring to the Air Intake Fairing  
(Ref. S.B.72-8746-284).

- (1) If the spring is formed into a loop, unscrew the tapered end from the free end and release the spring.
- (2) Mark the tapered end of the spring to enable the number of turns to be counted when the two ends are screwed together (Ref.72-09-00 Assembly - Temporary Marking).
- (3) Pre-load the spring by holding the free end and twisting (unscrewing) the tapered end two turns, then screw the tapered end into the free end for half a turn.
- (4) Check that the two ends have engaged with each other, and if not, release the spring and repeat operations (3) and (4).
- (5) Screw the tapered end into the free end one more turn.
- (6) Assemble the looped spring around the hollow of the air intake fairing plunged hole.

B. Installation of Damper Spring to the Air Intake Fairing  
(Ref. S.B.72-9005-409).

- (1) Cut 1.000 in. (25,4 mm) wide glass cloth tape (OMat 2/76) into two strips 0.500 in. (12,7 mm) wide by approx. 9.000 in. (228,6 mm) long. Apply one strip to the damper spring location, then repeat with the second strip. Ensure the start of the second tape run is close to the end of the first tape run, but not overlapping, to prevent the layers of tape becoming too uneven.
- (2) Mark the tapered end of the spring to enable the number of turns to be counted when the two ends are screwed together (Ref.70-00-12 - Temporary Marking).
- (3) Assemble spring. The reduced end of close coil spring is to be subject to reverse twist (anti-clockwise) of three turns and screwed clockwise into the open end to lock and form a circle. In the free state the spring must lie flat without twists.

OVERHAUL

- (4) Assemble the looped spring around the hollow of the air intake fairing plunged hole.

C. Installation of Air Intake Fairing.

- (1) Check that all work is completed, components and clips are secure and that area to be enclosed is clean and free from loose objects.
- (2) Apply lubricant B (Ref.72-09-00 Assembly, Servicing and Storage Materials) to attachment nuts.
- (3) Check that damper spring is assembled to flare of plunged hole in fairing inner skin (SB.OL.593-72-8746-284 and SB.OL.593-72-9005-409 Standard).
- (4) With fairing aligned with cut-out section facing lead support clip bracket, hold fairing squarely with bolts projecting slightly through faring flange.
- (5) Assemble a nut to each bolt and push the fairing squarely rearward until the bolts ends just protrude through the nuts with threads engaged.

NOTE: S.B. OL.593-72-8532-195 standard bolts have a plain lead end before the threads.

- (6) Press fairing fully home ensuring that spigot engages squarely.
- (7) Torque-tighten nuts to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

4. Paragraph Deleted.

5. Install the Engine Electrical Looms, Connectors and Supports

- A. Attach and connect the cable looms (Ref.71-00-02, Assembly, Engine Electrical Harness and Ignition Leads). Vibration transducer cable installation procedure is included in paragraph 2. of this stage.

# 6. Check the Clearances Between the Tubes and Accessories and the Engine

## A. Check Clearances (Ref.Fig.507).

**WARNING:** KERIMID 601 RESIN IS USED IN THE LAYERS OF FIRE RESISTANT WRAPPING ON FUEL TUBES TO SB.OL.593-73-8789-88 STANDARD ALTHOUGH HARMLESS IN ITS CURED STATE ON FINISHED TUBES, ITS VAPOUR IS POTENTIALLY CARCINOGENIC IF USED AS A TOUCH-UP FOLLOWING LOCAL DRESSING OF THE WRAPPING TO OBTAIN CORRECT CLEARANCES.

WHERE POST SB.OL.593-73-8789-88, PRE SB.OL.73-9057-102 STANDARD TUBES ARE LOCALLY DRESSED, EXISTING STOCKS OF KERIMID 601 CAN BE USED FOR LOCAL TOUCH-UP PROVIDED THE APPROPRIATE SAFETY MEASURES AND PRECAUTIONS ARE TAKEN. IF NO STOCKS OF KERIMID 601 EXIST, ARALOK 210 MAY BE USED FOR LOCAL TOUCH-UP WITH NO SAFETY MEASURES OR PRECAUTIONS REQUIRED. POST SB.OL.593-73-9057-102 TUBES MUST HAVE ARALOK 210 FOR LOCAL TOUCH-UP.

- (1) Ensure that an installed clearance exists between adjacent tubes and components. Comply with the clearance limits stated in Table 501 for specific tubes and components and ensure that the clearance between all other adjacent tubes and components is not less than 0.20 in. (5 mm). For additional data on location of tubes and accessories, refer to 71-00-01, Assembly Stage 1, Figure 501.

TUBES AND ACCESSORIES - ASSEMBLY

1. Transfer the Engine from the Horizontal Stillage to the Transport Trolley

A. Assemble Engine to Transport Trolley (Ref.Fig.501).

- (1) Assemble the beam type sling (Tool 1248) to the top lifting points of the engine, intermediate case/HP case flange and the delivery case/CCOC flange.
- (2) Support the weight of the engine with the crane and lifting sling.
- (3) Release and remove the pedestal clamps from the trunnion brackets. Remove the front supports from the LP case.
- (4) Lift the engine from the stillage.
- (5) Assemble the trolley adapters to the engine trunnions (Tool 1177 left-hand, 1193 right-hand) and secure.
- (6) Adjust the engine lifting sling to ensure that the engine is hanging square in the horizontal and vertical planes.
- (7) Position the trolley (Tool 1266) and lower engine until trunnion adapters engage pedestals.  
  
NOTE: Trolley has castoring wheels and is for shop use.
- (8) Secure the trunnion adapters with the pedestal clamps.
- (9) Assemble and secure the front engine supports to the LP casing.
- (10) Remove the lifting equipment.

TUBES AND ACCESSORIES - SPECIAL TOOLS,  
FIXTURES AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Table 1001 and 1002 are those required for the disassembly and assembly of the tubes and accessories to/from the engine.
- B. The tools have been listed in order of usage and the Tool Ref.No. is the number quoted in the text. Tools marked with an \* are used in more than one aspect of the overhaul and will be duplicated in the tables.

2. Tube and Accessories, Disassembly Tools

TOOL REF.NO.	MANUFACTURER PART NO.	DESCRIPTION
*1248	P3C.863655	Engine sling, beam type
*1265	P3C.865977	Mobile engine stand, shop use
* 261	P3C.1073000	Mobile engine stand, mounting bracket
* 808	P3C.1089461	Mobile engine stand, adapter
*1782	PE.209023	Drain tube, oil system
1783	P5J.1257462	Fuel drain adapter
1629	P3C.898067	Wrench cranked ring
1668	T.914825	Puller, general application
* 319	P5J.1266441	Adapter, jacking, LP compressor rotor
*1568	S3S.12558000	Crowfoot socket wrench attachment
*1529	P3C.1089171	Crowfoot socket wrench attachment
*1769	P3C.1262680	Protector, thermocouple harness
*1535	P0.1255624	Container harness
*1175	P3C.857340	Engine beam sling vertical/ horizontal
*1176	P3C.857341	Engine beam sling vertical/ horizontal
*1174	P3C.857339	Engine beam sling vertical/ horizontal
1244	P3C.863609	Build base
*1314	P3C.892833	Engine sling mobile stand
*1480	P3C.1065044	Wrench, open ring, socket

OVERHAUL

ELECTRICAL HARNESS AND IGNITION LEADS -  
REMOVAL FROM THE ENGINE

1. General

- A. This section details the removal of the electrical harness and high energy ignition leads from the engine.
- B. Prior to disassembly, refer to 71-09-00 Disassembly for general information.

2. Engine Electrical Harness - Removal from the Engine

A. General.

- (1) The electrical harness comprises seven multi-cable looms which connect the engine components to the aircraft systems at a common disconnect point (Ref.Fig.101).
- (2) A tray, support bracket and block assemblies located centrally under the engine form the unique point (Ref.Fig.101).
- (3) Straight screwed type connectors at each end of the cables connect to the engine components and to the common disconnect point (Ref.Fig.101).
- (4) Identification of the looms is by tape markers secured to the looms. Markers secured on each loom close to the disconnect connector identify the loom by serial number, part number and letter (Ref.Fig.101).
- (5) Ensure that the electrical harness on removal from the engine is clean and dry, correctly blanked and that the assembly is placed in a clean container for protection.
- (6) Ensure all exposed connections on the engine are suitably blanked.
- (7) Discard the rubber packing strips from the loop clamps after the removal of the loop clamps from the harness.

- B. Remove Transportation Parts (Ref.Fig.102).

OVERHAUL

(1) General.

To prevent damage during transportation the harness is secured by five harness supports and a mounting plate assembly secured to the engine.

(2) Remove mounting plate.

- (a) Disconnect the seven plugs from their mating dummy receptacles.
- (b) (Post Mod.0L.8180 incorporated). Remove nut, washer and bolt securing spring clip to bracket. Remove clip from the tube and retain for transportation purposes.
- (c) Remove two wingscrews securing the mounting plate to brackets. Remove the mounting plate from the engine and retain for transportation purposes.

(3) Remove harness supports.

- (a) Support A. Remove wingscrew securing clip to harness. Unstrap the harness and remove from the electrical loom.
- (b) Support B. Unstrap the harness and remove from the electrical loom.
- (c) Support C. Unclip harness support from tube. Unstrap the harness and remove from the electrical loom.
- (d) Support D. Unclip harness support from tube. Unstrap the harness and remove from the electrical loom.
- (e) Support E. Remove wingscrew securing harness to the tube. Unstrap the harness support and remove from the electrical loom.
- (f) Retain removed harness supports for transportation purposes.

C. Disconnect Electrical Harness Plugs (Ref.Fig.103, 104 and 105).

(1) General.

OVERHAUL

To assist identification and location, the plugs are identified by a letter and number e.g. E.1. Location of the plug is by the nomenclature of the component to which the plug is connected. Refer to diagrammatic layout of the harness.

- (2) Disconnect harness plugs - intake case.
  - (a) Disconnect F.1 from the igniter box.
- (3) Disconnect harness plugs - LP compressor case.
  - (a) Disconnect F.2 from the oil contents transmitter.
  - (b) Disconnect G.9 from the fuel recirculating control valve.
  - (c) Disconnect E.16 from the hydraulic pump pressure switch (Pre-SB.71-7). Connection point deleted by SB.71-7.
  - (d) Disconnect C.8 from the fuel filter differential pressure switch indicator.
  - (e) Disconnect G.2 from the fuel filter differential pressure switch heater valve control (Pre-Mod. 8316). Connection point deleted by Mod.8316.
  - (f) Disconnect C.5 from the anti-icing pressure switch.
  - (g) Disconnect D.4 from the air starter motor valve actuator and pressure indicator.
  - (h) Disconnect G.6 from the engine oil inlet thermometer.
  - (j) Disconnect G.1 from the fuel filter inlet thermometer heater valve control.
  - (k) Disconnect D.6 from the engine LP governor speed probe (Pre-Mod.8314). Connection point deleted by Mod.8314.
  - (l) Disconnect H.1 from the hydraulic pump off load valve.

- (4) Disconnect harness plugs - exit guide vane case.
  - (a) Disconnect H.7 from the hydraulic pump pressure switch or the parking position (Pre SB.71-7) using wrench (Tool 1592). Both positions deleted with the embodiment of SB.71-7.
  - (b) Disconnect H.4/B.1 from the No.1 probe.
- (5) Disconnect harness plugs - intermediate case.
  - (a) Disconnect C.1 from the throttle actuator, No.1 (main).
  - (b) Disconnect H.5/B.2 from the No.2 probe.
  - (c) Disconnect H.3 from the engine oil low pressure switch.
  - (d) Disconnect D.2 from the engine oil pressure transmitter.
- (6) Disconnect harness plugs - HP compressor case.
  - (a) Disconnect D.7 from the LP governor control valve solenoid.
  - (b) Disconnect G.8 from the throttle actuator, No.2 (alternative).
  - (c) Disconnect F.5 from the engine fuel flowmeter.
  - (d) Disconnect G.10 from the S.O.V. indicator switch.
  - (e) Disconnect C.3 from the reheat shut-off valve control solenoid.
  - (f) Disconnect F.6 from the reheat fuel flowmeter.
  - (g) Disconnect D.9 from the No.4 bearing failure warning oil outlet thermometer.
  - (h) Disconnect D.10 from the No.4 bearing failure warning oil inlet thermometer.
  - (j) Disconnect C.6 from the hydraulic pump off load valve.
  - (k) Disconnect C.7 from the fuel starting pump.

- (l) Disconnect E.1 from the IDG disconnect solenoid.
  - (m) Disconnect E.2 from the IDG oil temperature thermometer (inlet).
  - (n) Disconnect E.3 from the IDG oil temperature thermometer (outlet).
  - (p) Disconnect D.1 from the IDG speed probe.
  - (q) Disconnect D.5 from the IDG oil pressure switch.
  - (r) Disconnect D.11 from the IDG mag trim.
  - (s) Disconnect C.2 from the receptacle connector at the bracket on the second stage fuel pump (SB.0L.593-71-8988-32 standard).
  - (t) Remove the nuts and screws and disconnect the receptacle connector from the bracket on the second stage fuel pump (SB.0L.593-71-8988-32 standard).
- (7) Disconnect harness plugs - HP compressor diffuser case.
- (a) Disconnect G.4 from the fuel inlet manifold thermometer.
  - (b) Disconnect C.4 from the reheat purge valve position sensor.
  - (c) Disconnect C.2 from the reheat control motor.
  - (d) Disconnect E.9 from the reheat purge valve solenoid.
- (8) Disconnect harness plugs - combustion chamber case.
- (a) Disconnect E.8 from the reheat flame detector.
  - (b) Disconnect E.11 from the fuel heater air valve solenoid.
  - (c) Disconnect E.5 from the air valve (anti-icing) solenoid (Ref.Fig.119 and 120) (Pre and SB.71-16 standard).

(9) Remove the reheat FCU jump lead (SB.0L.593-71-8988-32 Part 3 standard).

(a) Disconnect the connector plug of the reheat FCU jump lead from the reheat control motor.

(b) Cut the lacing braids which attach the electrical harness to the reheat FCU jump lead.

(c) Remove the jump lead.

D. Remove Electrical Harness Clamps (Ref.Figs.106 and 107).

(1) General.

(a) To identify and locate a clamp on the engine, a grid system with a location number and letter is used in the text e.g. 8C. Refer to Figs.106 and 107 for the grid system.

(b) To facilitate removal of the harness, the complete harness has been broken down into three runs or legs. The order of removal is not obligatory providing all precautions are taken to prevent damage to the harness.

(2) Remove clamps securing the first harness run (Ref. Fig.108).

(a) Clamp 28L (Ref.Fig.109).

(i) Remove the nut and bolt securing the two clamps to the bracket.

(ii) Release the clamps from the harness.

(b) Clamp 32K (Ref.Fig.109).

(i) Remove the nut and bolt securing the clamp to the oil tube.

(ii) Release the clamp from the harness.

(c) Clamp 34K (Ref.Fig.109).

(i) Remove the bolt securing the clamp to the bracket.

- (s) Clamp 8W (SB.71-16) (Ref.Fig.124)
  - (i) Remove the nut and bolt securing the clamp to the tray assembly.
  - (ii) Release the clamp from the harness.
- (t) Clamp 7W (Ref.Fig.123 and 124) (Pre and SB.71-16 standard).
  - (i) Remove the nut and bolt securing the clamp/clamps to the tray assembly.
  - (ii) Release the clamp/clamps from the harness.
- E. Release Electrical Harness from the Front and Rear Block Assemblies (Ref.Fig.101).
  - (1) Rear block assembly.
    - (a) Remove two nuts securing the top block and release the cables.
    - (b) Remove the two special bolts securing the middle block using a 0.3125 AF spanner on the flats and release the cables.
  - (2) Front block assembly.
    - (a) Remove two bolts securing the top block and release the harness.
    - (b) Carefully remove the complete electrical harness assembly from the engine and prepare for installation in the special transportation container.
- F. Remove Electrical Harness Support Trays and Mounting Brackets from the Engine.
  - (1) General.
    - (a) To identify and locate a support tray or mounting bracket on the engine, a grid system with a location number and letter is used in the text e.g. 8C/9E.
    - (b) Refer to Fig.105 for the grid system.

- (2) Remove support tray 8C/9E.
  - (a) Remove the nut securing the tray to the pillar bolt.
  - (b) Remove the tray and pillar bolt from the engine.
- (3) Remove support tray 11G/15G.
  - (a) Remove clamp 15G.
    - (i) Remove the nut and bolt securing the tray to the tube with a clamp.
    - (ii) Remove the inner and outer clamps, washer and bush.
  - (b) Remove clamp 13F.
    - (i) Remove the nut and bolt securing the tray to the tube with a clamp.
    - (ii) Remove the inner and outer clamps, washer and bush.
  - (c) Remove clamp 13G.
    - (i) Remove the nut and bolt securing the tray to the tube with a clamp.
    - (ii) Remove the inner and outer clamps, washer and bush.
  - (d) Remove the tray from the engine.
- (4) Remove support tray 7W/13W.
  - (a) Remove the nut and bolt securing the tray to the engine.
  - (b) Remove the tray from the engine.
- (5) Paragraph deleted.
- (6) Remove mounting bracket 16V.
  - (a) Remove the two nuts and bolts securing the bracket to the engine.
  - (b) Remove the bracket from the engine.

OVERHAUL

### 3. High Energy Ignition Leads - Removal from the Engine

#### A. General.

- (1) The engine ignition leads consist of two high energy leads connected between the ignition unit and the two igniter plugs.
- (2) During removal of the igniter leads from the engine, care must be taken not to damage the leads or connectors.
- (3) Ensure that the igniter leads on removal from the engine are clean and dry, the connectors are protected and that the assembly is placed in a clean container for protection.
- (4) Ensure exposed connectors on the ignition unit and the igniter plugs are protected.
- (5) Discard the rubber packing strips from the loop clamps (Pre SB.0L.593-74-9084-19) after their removal from the leads.

#### B. Remove the Igniter Leads from the Engine (Ref.Fig.125 and 126).

- (1) Remove both ignition leads from the ignition unit using wrench (Tool 1664) and install suitable blanks and protectors to the exposed cable ends.
- (2) Reference point 'A' (Pre SB.0L.593-9084-19 standard).
  - (a) Remove the bolt securing the clamp to the bracket.
  - (b) Release the clamp from the lead.
  - (c) Remove the clipnut from the bracket.
- (3) Reference point 'A' (SB.0L.593-9084-19 standard).
  - (a) Remove the bolt securing the clip to the bracket.
  - (b) Remove spacer.
  - (c) Release the clip from the lead.
  - (d) Remove the clipnut from the bracket.

ELECTRICAL HARNESS AND HIGH ENERGY (HE) IGNITION LEADS  
- ASSEMBLY ON THE ENGINE

1. General

- A. This section details the assembly of the electrical harness and high energy (HE) ignition leads to the engine.
- B. Before commencing assembly of the electrical harness and ignition leads, refer to 71-09-00, Assembly, for general information.
- C. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title, e.g. nuts, bolts, clamps etc. When the item is a part of the breakdown of the text concerned, the item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items of a different breakdown are introduced, the breakdown number will be quoted in addition, e.g. bolt (72-32-01/1-10).
- D. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the assembly of the electrical harness and ignition leads and for the Manufacturers Part No. refer to the Special Tools, Fixtures and Equipment, Table 1002.

2. Engine Electrical Harness - Assembly on the Engine

A. General.

- (1) The electrical harness comprises seven multi-cable looms which connect the engine components to the aircraft systems at a common connection point (Ref.Fig.501).
- (2) A tray, support bracket and block assemblies located centrally under the engine form the unique point (Ref.Fig.501).

OLYMPUS 593 MK 610-14-28

### OVERHAUL MANUAL

This Temporary Revision complies with BCAR's Chapter A6-2 and TSS No. 0-2

*P. Munn*

for Chief Engineer (Technical & Quality Services) CAA Design Approval No. DA1/8566/78

TEMPORARY REVISION 71-507

Insert in 71-00-02 facing page 501

#### REASON FOR ISSUE

Change in policy on wirelocking self locking engine harness plugs.  
(MCR.ETE.1.AAG.7453/6.7)

#### ACTION

Reference 1. General addition of Paragraphs E. and F. as follows:-

#### E. Concorde Engine Harness - HTMAS Self Locking Connectors

It has been established (by trial modification and consultation with Rolls Royce) that HTMAS self locking connectors do not require wirelocking other than for services that have particular flight connotations which make it prudent to wirelock.

A list of engine harness connectors which must remain wirelocked is set out below, but all other engine harness connectors do not require wirelocking.

#### Olympus Engine Harness Connectors which MUST be Wirelocked

- B1 - LP Pulse Probe
- B2 - HP Pulse Probe
- C2 - Reheat FCU, Fuel metering valve motor
- C3 - Reheat FCU, Shut of valve solenoid
- F5 - Engine Mainfuel Flowmeter Fe
- F6 - Reheat Fuel Flowmeter Fr
- E1 - IDG Disconnect Solenoid

- F Main Engine Disconnect Box
- E Main Engine Disconnect Box
- C Main Engine Disconnect Box
- B Main Engine Disconnect Box

(As defined in MM 71-50-00 pg 2 and pg 4 and OHM 71-00-02 pg 505 and (507/508). Engine harness connectors other than those stated above do not require wirelocking.

# BRITISH AIRWAYS

TEMPORARY REVISION 71-507 (Cont'd.)

ACTION (cont'd.)

## F. Tightening Engine Harness HTMAS connectors

---

- a. Align keyway and mate connector by holding the connector end bell (cable clamp).
- b. "Wiggle" the end bell and then tighten the coupling nut as the plug moves inwards.
- c. Continue wiggling the end bell and then tightening the coupling nut until no further movement of the end bell can be made.
- d. Finger tighten the coupling nut.

CAUTION:- DO NOT OVERTIGHTEN OR DAMAGE MAY OCCUR.

OVERHAUL

- (3) Straight screwed type connectors at each end of the cables connect to the engine components and to the common connection point (Ref.Fig.501).
- (4) Identification of the looms is by tape markers secured to the looms. Markers secured on each loom close to the connection identify the loom by serial number, part number and letter (Ref.Fig.501).
- (5) For identification of parts used during assembly, refer to paragraph 1.C. and I.P.C. 71-51-01.
- (6) Lubricate nuts and bolts with lubricant 'B' (Ref.71-09-00, Table 501) except where indicated.
- (7) Following assembly, all electrical harnesses must be checked to ensure that the cable runs are free from fouls, and are clipped correctly to give adequate clearance.
- (8) Ensure that all electrical connections connected to services and accessories are wire-locked correctly, where applicable.

B. Assembly of Electrical Harness Assembly to the Unique Point Cable Clamp (Ref.Fig.501).

- (1) To the electrical unique point tray assembled to the centre mounting bracket, located on the HP blow-off straps bottom centre line, assemble the looms: H, F, D and C. From the longitudinal centre line of the clamp:

Loom H	72.25 in.	(1835,15 mm)	to the rear.
Loom F	72.00 in.	(1828,80 mm)	to the rear.
Loom D	73.00 in.	(1853,40 mm)	to the rear.
Loom C	72.25 in.	(1835,15 mm)	to the rear.

Hold the looms in position and assemble the middle block (10-70) and retain with two bolts (10-60). When blocks touch, the bolts must be released so that the flats on the bolts will line up with the flats in top block (10-50).

CAUTION: ON NO ACCOUNT MUST THE BOLTS (10-60) BE TIGHTENED TO OBTAIN ALIGNMENT.

ASSEMBLY

71-00-02

# OLYMPUS 593

MK.610-14-28 *sneema*  
OVERHAUL

- (2) To the middle block assemble the looms B, E and G.  
From the longitudinal centre of the clamp block:

Loom B	73.25 in.	(1859,75 mm)	to the rear.
Loom E	73.00 in.	(1853,40 mm)	to the rear.
Loom G	72.25 in.	(1835,15 mm)	to the rear.

Hold the looms in position and assemble the top block (10-50), retain the top block with nuts (10-40).  
Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (3) Assemble bottom clamp block (10-30) to the unique point tray (10-200), assemble the looms H, F, D, C, B, G to the bottom clamp block and retain with the top clamp block (10-20), bolts (10-10) and nuts (10-240). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

C. Assembly of the First Run of the Electrical Harness to the Engine (Ref.Fig.502, 503, 504, 505, 506 and 507).

- (1) Having established the unique point and the loom lengths to the rear the first clamping position grid-reference 28L will be installed. At this position both the first run and second run are assembled at the same position, thereafter only the first run of the harness will be referred to. The first run is composed of the following identities:

(2) Assembly of first run by grid-reference.

(a) Grid-reference 28L (Ref.Fig.508).

Assemble the electrical harness to the bracket (72-01-04/2-30) on the LP and HP compressor thrust (No.2 and 3) bearing oil scavenge tube, located near the bottom centre line, approximately mid-way of HP compressor case, with loop clamps (5-70) and (5-80), bolt (5-60) and nut (5-50). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(b) Grid-reference 32K (Ref.Fig.508).

Assemble the electrical harness to the LP and HP compressor thrust (No.2 and 3) bearing scavenge oil tube (72-01-04/2-60), located near the HP front flange, to the left of the bottom centre line, with loop clamp (5-40), existing nut (75-02-10/1-110) and bolt (75-02-10/1-130). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m) with lubricant 'A' applied.

(c) Grid-reference 34K (Ref.Fig.508).

Assemble the electrical harness to an existing bracket (72-01-04/3-380) on the LP turbine (No.5) bearing oil return tube flange to oil pump located approximately mid-way of intermediate casing, to the left of bottom centre line, with loop clamp (5-30), clipnut (5-20), and bolt (5-10). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(d) Grid-reference 35K (Ref.Fig.508).

Assemble the electrical harness to an existing bracket (72-65-00/1-70) on the main oil pump, located on the intermediate case, with loop clamp (4-280), bolt (4-270), and nut (4-260). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(e) Grid-reference 37K (Ref.Fig.508).

Assemble the electrical harness to an existing bracket (72-01-03/1-300) on the LP compressor front (No.1) bearing oil feed tube flange to main oil pump, located approximately at mid-exit guide vane casing to the left of bottom centre line, with loop clamp (4-280), bolt (4-270), and nut (4-260). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(f) Grid-reference 38K (Ref.Fig.508).

Assemble the electrical harness to an existing bracket (72-01-03/1-300) on the LP compressor front (No.1) bearing oil feed tube flange to main oil pump, located approximately at mid-exit guide vane casing to the left of bottom centre line, with loop clamp (4-250), clipnut (4-240), and bolt (4-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(g) Grid-reference 40K (Ref.Fig.509).

Assemble pillar bolt (4-110) to existing bracket (72-31-01/5-410) on the LP rear blow-off flange at bolt-hole positions 37 and 38 with nut (4-100). Assemble the electrical harness to the pillar bolt using loop clamps (4-120 and 4-130) and nut (4-100). Torque-tighten assembly items to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(h) Grid-reference 42K (Ref.Fig.509).

Assemble the electrical harness to an existing bracket (72-01-04/1-230) on the LP compressor front (No.1) bearing oil return tube just forward of the LP rear blow-off flange, near bottom centre line, with loop clamp (4-90), bolt (4-80) and nut (4-70). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (j) Grid-reference 44K (Ref.Fig.509).

Assemble the electrical harness to an existing pillar bolt (73-13-09/1-150) on the bracket (72-31-01/4-430) attached to the LP front blow-off flange to the left of bottom centre line, with loop clamp (2-250) and existing nut (73-13-09/1-130). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug G9 to the engine fuel recirculation valve.

## (k) Grid-reference 45J (Ref.Fig.509).

Assemble the electrical harness to an existing bracket (79-11-02/1-30) on the oil tank filler connection flange, with loop clamp (2-240), bolt (2-230), and nut (2-220). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (l) Grid-reference 46J (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (79-11-02/1-40) on the oil tank filler connection flange with loop clamp (2-240), bolt (2-230), and nut (2-220). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug F2 to the oil tank contents transmitter and overfill switch.

## (m) Grid-reference 47J (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (79-31-01/1-100) on the oil contents gauge flange, with loop clamp (2-210), clipnut (2-200), and bolt (2-190). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (n) Grid-reference 48J (Ref.Fig.510).

Assemble the electrical harness to an existing pillar bolt (72-01-03/1-90) on the LP to intake flange with loop clamps (2-140) (2-150) and existing nut (72-01-03/1-100). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

ASSEMBLY

**71-00-02**

OVERHAUL

(p) Grid-reference 48H (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (75-11-01/2-180) attached to the anti-icing manifold on the air intake casing, with loop clamp (2-180), bolt (2-170) and nut (2-160). If the ignition lead has still to be clamped at this position, lightly tighten the nut. After installation of the ignition lead torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug F1 to the ignition unit.

(q) Grid-reference 47M (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (72-22-01/4-140) on the LP to intake casing flange, with loop clamp (2-130), bolt (2-120) and nut (2-110).

NOTE: Assemble the above items loosely pending the fitting of the high energy ignition (HE) leads at this position then torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(r) Grid-reference 47N (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (72-31-01/4-260) on the LP to intake casing flange, with loop clamp (2-100), bolt (2-90) and nut (2-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(s) Grid-reference 47P (Ref.Fig.510).

Assemble the electrical harness to an existing bracket (72-31-01/4-260) on the LP to intake casing flange, with loop clamp (2-100), bolt (2-90) and nut (2-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(t) Grid-reference 47R (Ref.Fig.511).

Assemble the electrical harness to an existing bracket (72-22-01/4-200) on the LP to intake casing flange, with loop clamp (2-100), bolt (2-90) and nut (2-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(u) Grid-reference 47T (Ref.Fig.511).

Assemble the electrical harness to an existing pillar bolt (75-02-08/1-30) secured to a bracket on the LP to intake casing flange, with loop clamp (2-70) and existing nut (75-02-08/1-20). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(v) Paragraph deleted.

**OLYMPUS 593****MK.610-14-28    snecma  
OVERHAUL**

**(w)    Grid-reference 43J (Ref.Fig.509).**

Assemble the electrical harness to an existing bracket (79-22-01/1-55) on the oil tank to pump flange, with loop clamp (4-60), bolt (4-50) and nut (4-40). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

**(x)    Grid-reference 43H (Ref.Fig.509).**

Assemble the electrical harness to an existing bracket (79-22-01/1-55) on the oil tank to pump flange, with loop clamp (4-30), bolt (4-10) and clipnut (4-20). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect plug C8 to the fuel differential pressure warning switch (7 psi).

**(y)    Grid-reference 40M (Ref.Fig.509).**

Assemble the electrical harness to pillar bolt (3-220) on the LP rear blow-off flange bracket (72-31-01/5-300) at bolt-holes (36-35), with loop clamp (3-230), washer (3-210) and two nuts (3-200). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

**(z)    Grid-reference 38N (Ref.Fig.512).**

Secure the electrical harness to the existing bracket (73-22-01/1-40) on the pulse probe mounting at the rear of the LP blow-off flange, bottom centre line, with loop clamp (3-190) and existing nut, washer and bolt (71-73-02/5-20-30-40) torque-tightened to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock H4/B1 plug to the LP compressor RPM probe.

(am) Grid-reference 39G (Ref.Fig.513).

Assemble the electrical harness to the existing bracket (79-22-01/1-110) on the oil pump flange, with loop clamp (4-160), bolt (4-150) and nut (4-140). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(an) Grid-reference 40G (Ref.Fig.513).

Assemble the electrical harness to the existing bracket (79-22-01/1-55) on the tank to pump oil tube, with loop clamp (4-160), bolt (4-150) and nut (4-140). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug Gt to the fuel heater control thermometer and plug G6 to the engine oil inlet thermometer.

(ap) Grid-reference 37L (Ref.Fig.513).

Assemble the electrical harness to the existing bracket (73-13-03/1-230) on the reheat fuel filter flange, with loop clamp (3-260), bolt (3-250) and nut (3-240). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(aq) Grid-reference 37M (Ref.Fig.513).

Assemble the electrical harness to the existing bracket (73-13-03/1-230) on the reheat pump fuel filter flange, with loop clamp (3-290), bolt (3-270) and clipnut (3-280). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

D. Assembly of the Second Run of the Electrical Harness to the Engine (Ref.Fig.502, 503, 504, 505, 506, 514 and 515).

(1) The second run of the harness contains the following identities:

D9	-	HP turbine bearing oil drain thermometer.
F6	-	Reheat fuel flowmeter.
H5/B2	-	HP compressor RPM probe.
C1	-	Throttle actuator gearbox (main).
D7	-	N1 governor valve.

- G8 - Throttle actuator gearbox (alt.)
- F5 - Engine fuel flowmeter.
- C3 - Reheat controller shut-off valve solenoid.
- G10 - HP valve position indicator.
- D10 - HP turbine bearing oil inlet thermometer.
- G4 - Fuel nozzle inlet thermometer.
- C2 - Reheat controller motor (Pre-SB.0L.593-71-8988-32).
- C2 - Bracket on the second stage fuel pump (SB.0L.593-71-8988-32).
- C4 - Reheat purge valve position transducer.
- E11 - Engine fuel heater control valve.
- E8 - Reheat flame detector.

(2) Assembly of second run by grid-reference.

(a) Grid-reference 29J (Ref.Fig.516).

Assemble the electrical harness to the existing bracket (73-13-08/1-280) on the fuel control unit, on the left-hand gearbox, with loop clamp (5-90), existing nut (73-13-02/1-20), bolt (73-13-02/1-40) and washer (73-13-02/1-30). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug D9 to the HP turbine (No.4) bearing oil drain thermometer and plug F6 to the reheat fuel flowmeter.

(b) Grid-reference 30H (Ref.Fig.516).

Assemble the electrical harness to the existing bracket (73-13-08/1-280) on the fuel control unit, on the left-hand gearbox, with loop clamp (5-120), bolt (5-100) and clipnut (5-110). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(c) Grid-reference 31G (Ref.Fig.516).

Assemble the electrical harness to the existing bracket (73-13-08/1-280) on the fuel control unit on the left-hand gearbox, with loop clamp (5-120), bolt (5-100) and clipnut (5-110). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (d) Grid-reference 33F (Ref.Fig.516).

Assemble the electrical harness to the existing bracket (72-65-00/5-100) on the main oil pump flange, with loop clamp (5-130) and existing clipnut (71-73-02/2-100) and bolt (71-73-02/2-90). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (e) Grid-reference 29E (Pre-SB.0L.593-71-8988-32 standard) (Ref.Fig.517).

Assemble the electrical harness to the existing bracket (73-11-02/1-10) on the second stage fuel pump located on the left-hand side of the engine, forward of the HP compressor, with loop clamp (5-160), bolt (5-140) and clipnut (5-150). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Connect, tighten and wire-lock plug H5/B2 to the HP compressor RPM probe, plug C1 to the throttle actuator gearbox (Main), plug D7 to the N1 governor valve and plug G8 to the throttle actuator gearbox (Alt).

- (f) Grid-reference 29E (SB.0L.71-8988-32 standard) (Ref.Fig.518).

Assemble the electrical harness to the existing bracket (73-11-02/1-10) on the second stage fuel pump located on the left-hand side of the engine, forward of the HP compressor, with loop clamp, packing strip, spacer and bolt (71-51-01/5-160/6-160/5-165/5-195). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Connect, tighten and wire-lock plug H5/B2 to the HP compressor RPM probe, plug C1 to the throttle actuator gearbox (Main), plug D7 to the N1 governor valve, plug G8 to the throttle actuator gearbox (Alt) and plug C2 to the connector receptacle at the bracket on the second stage fuel pump. Connect the receptacle connector of the reheat FCU flylead (SB.0L.593-71-8988-32 Parts 1 and 2 standard) or the reheat FCU jumplead (71-51-01/1-25) (SB.0L.593-71-8988-32 Part 3 standard) to the bracket on the second stage fuel pump with the four screws and self-locking nuts (71-51-01/13-16/17).

- (g) Grid-reference 26F (Pre-SB.0L.593-71-8988-32 standard) (Ref.Fig.517).

Assemble the electrical harness to the existing bracket (75-02-02/1-70) on the control unit to engine flowmeter, with loop clamp (5-170) and existing nut (71-73-02/3-140), washer (71-73-02/3-150) and bolt (71-73-02/3-160). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

- (h) Grid-reference 26F (SB.0L.593-71-8988-32 Parts 1 and 2 standard) (Ref.Fig.518).

Assemble the electrical harness to the existing bracket (75-02-02/1-70) on the control unit to engine flowmeter, with loop clamp and packing strip (71-51-01/5-170/6-160) and existing nut (71-73-02/3-140), washer (71-73-02/3-150) and bolt (71-73-02/3-160). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

- (j) Grid-reference 26F (SB.0L.593-71-8988-32 Part 3 standard) (Ref.Fig.518).

Assemble the electrical harness and the reheat FCU jumplead (71-51-01/1-25) to the existing bracket (75-02-02/1-70) on the control unit to engine flowmeter, with loop clamp and packing strip (71-51-01/5-171/6-160) and existing nut (71-73-02/3-140), washer (71-73-02/3-150) and bolt (71-73-02/3-160). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Attach the electrical harness and the reheat FCU jumplead together with the lacing braid (Tygadure T085) as shown.

- (k) Grid-reference 26E (Ref.Fig.517).

Assemble the electrical harness to the existing bracket (75-02-02/1-70) on the control unit to engine flowmeter, with loop clamp (5-200), bolt (5-190) and nut (5-180). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m).

(ah) Grid-reference 8C (ref.Fig.519).

Assemble the electrical harness to the existing tray assembly (7-290), located to the rear of the combustion chamber outer casing, left-hand side of the engine, with loop clamp (7-240), bolt (7-230) and nut (7-220). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m). Connect, tighten and wire-lock plug E8 to the reheat flame detector.

E. Assembly of the Third Run of the Electrical Harness to the Engine (Ref.Fig.502, 503, 504, 505, 506 and 520).

(1) The third run of the harness contains the following identities:

- C6 - Hydraulic pump off-load valve.
- H3 - Engine oil low pressure switch.
- D2 - Engine oil pressure transmitter.
- C7 - Electric starter pump.
- E1 - IDG disconnect solenoid.
- E2 - IDG oil inlet thermometer.
- E3 - IDG oil outlet thermometer.
- D1 - IDG mag. trim.
- D5 - IDG oil low pressure switch.
- D11 - IDG speed probe.
- E9 - Reheat purge valve.
- E5 - Engine anti-icing air pressure control valve.

(2) Assembly of third run by grid-reference.

(a) Grid-reference 27S (Ref.Fig.521).

Assemble the electrical harness to the existing bracket (72-33-01/5-360) at the starter pump mounting bracket, with loop clamp (8-30), existing nut (71-73-02/5-380) and bolt (71-73-02/5-400). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (b) Grid-reference 29S (Ref.Fig.521).

Assemble the electrical harness to the starter pump support bracket (72-33-01/5-90) with loop clamp (8-30), existing nut (71-73-02/5-320) and bolt (71-73-02/5-330). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (c) Grid-reference 31S (Ref.Fig.521).

Assemble the electrical harness to the existing bracket (71-73-02/5-300) on the reheat fuel feed support bracket at the intermediate case rear flange, with loop clamp (8-10), existing clipnut (71-73-02/5-240) and bolt (71-73-02/5-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug H3 to the engine oil low pressure switch and plug D2 to the engine oil pressure transmitter. On SB.71-9056-33 standard engines, ensure that a minimum slack exists of between 0.750 in. (19,05 mm) and 1.000 in. (25,40 mm) at the halfway point between the plug and the first clipping point.

## (d) Grid-reference 29U (Ref.Fig.521).

Assemble the electrical harness to the starter pump support bracket (72-33-01/5-90), with loop clamp (8-20), existing pillar bolt (73-13-11/1-330) and nut (73-13-11/1-310). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Use lubricant A.

(e) Assemble the dummy receptacle (72-33-01/5-30), for C6 plug parking, to the starter pump support bracket (72-33-01/5-100), with dummy receptacle pan head screws (72-33-01/5-20) and nuts (72-33-01/5-10). Torque-tighten to between 8 and 10 lbf in. (0,9 and 1,1 N.m) using wrench (Tool 1592). Connect, tighten and wire-lock plug C6 to the hydraulic pump off-load valve. If valve is not fitted, assemble to the dummy receptacle previously installed.

OVERHAUL

## (f) Grid-reference 25T (Ref.Fig.521).

Assemble the electrical harness to the starter pump mounting bracket (72-33-01/5-360), with loop clamp (8-60), bolt (8-50) and nut (8-40). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (g) Grid-reference 24U (Ref.Fig.522).

Assemble the electrical harness to the existing bracket (72-33-01/7-140) supporting the IDG unit to cooler oil tubes, with loop clamp (8-90), bolt (8-70) and clipnut (8-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug C7 to the electric starter pump. Connect, tighten and wire-lock plug E1, E2, E3 to the existing bracket on the IDG. If the unit is not fitted, suitably blank and stow plugs. Connect, tighten and wire-lock plug D1, D5, D11 to the existing bracket on the IDG. If the IDG is not installed, suitably blank and stow plugs.

## (h) Grid-references 21U (Ref.Fig.522).

Assemble the electrical harness to the existing bracket (75-01-04/1-170) supporting the air duct at the delivery case front flange, with loop clamp (8-120), bolt (8-100) and clipnut (8-110). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (j) Grid-reference 19U (Ref.Fig.522).

Assemble the electrical harness to the existing bracket (75-01-04/1-160) supporting the air duct at the delivery case front flange, with loop clamp (8-130), existing clipnut (74-21-01/2-190) and bolt (74-21-01/2-160, Pre SB.71-1, 2-170, SB.71-1). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m). Connect, tighten and wire-lock plug E9 to the reheat purge valve.

OVERHAUL

(k) Grid-reference 17V (Ref.Fig.522).

(i) Assemble bracket (9-60) to the existing bracket on the delivery case rear flange, near the starboard igniter with two bolts (9-50) and nuts (9-40). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(ii) Assemble the electrical harness to bracket (9-60), with loop clamp (8-160), bolt (8-140) and clipnut (8-150). Do not torque-tighten until HE igniter lead has been installed at reference point 'Ac' (para.3.C.(24)), then torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(l) Grid-reference 16V (Ref.Fig.522).

Assemble the electrical harness to bracket (9-60), with loop clamp (8-190), bolt (8-170) and clipnut (8-180). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(m) Grid-reference 15W (Ref.Fig.522).

Assemble the electrical harness to bracket (9-60), with loop clamp (9-30), bolt (9-10) and clipnut (9-20). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(n) Grid-reference 13W (Ref.Fig.522).

Loosely assemble the electrical harness to tray (9-230), attached to the anti-icing valve and tube, with loop clamp (9-90), bolt (9-80) and nut (9-70). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)).

OVERHAUL

(p) Grid-reference 12W (Ref.Fig.522).

(i) Loosely assemble the electrical harness to tray (9-230) Pre SB.71-17, with loop clamp (9-130) and secure the tray to the anti-icing tube with inner clamp (9-160), outer clamp (9-150), bush (9-170), bolt (9-120) and nut (9-100). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)).

(ii) Loosely assemble the electrical harness to tray (9-230) SB.71-17, with loop clamp (9-130), bolt (9-120) and nut (9-70). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)).

(q) Grid-reference 11W (Ref.Fig.522).

Loosely assemble the electrical harness to tray (9-230), with loop clamp (9-200), bolt (9-190) and nut (9-180). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)). Connect, tighten and wire-lock plug E5 to the anti-icing control valve solenoid.

(r) Grid-reference 9W (Ref.Fig.522).

Loosely assemble the electrical harness to tray (9-230), with loop clamp (9-200), bolt (9-190) and nut (9-180). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)).

(s) Grid-reference 8W (SB.71-16) (Ref.Fig.523).

Loosely assemble the electrical harness to tray (9-230), with loop clamp (9-205), bolt (9-196) and nut (9-180). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable has been adjusted (Ref.para.2.E.(2)(s)).

ASSEMBLY

OVERHAUL

- (t) Grid-reference 7W (Ref.Fig.522 and 523) (Pre and SB.71-16 standard).

NOTE: Plug E15 is no longer required, and the cable is tied back. Refer to SB 77-8876-32 for details.

Loosely assemble the electrical harness to tray (9-230), with loop clamp/clamps (9-200), bolt (Pre SB.71-16, 9-190) (SB.71-16, 9-194) and nut (9-180). Torque-tighten to between 67 and 73 lbf in. (7,6 and 8,2 N.m) after cable/cables have been adjusted. Ensure that there is minimum total lateral deflection of 1.000 in. (25,4 mm) of the cable between loop clamp grid-references 12W and 11W. Adjust as necessary then recheck after torque-tightening.

## F. Install Transportation Parts (Ref.Fig.524).

### (1) General.

To prevent damage during transportation, the harness is secured by five harness supports and a mounting plate assembly secured to the engine.

### (2) Assembly of mounting plate.

- (a) Assemble the mounting plate (11-110) to the reheat fuel tube with bush (11-240), spring clips (11-220, 230), washer (11-200), nut (11-190) and screw (11-210).
- (b) Secure the mounting plate brackets to the brackets on the exhaust diffuser and the spherical joint flange attachment with thumbnut (11-130) and wingscrew (11-180).
- (c) Connect the seven electrical harness connectors to their respective receptacles.

## (3) Assembly of harness supports.

- (a) Support A. Secure support (11-10) to bracket on the delivery casing and C00C attachment flange using wingscrew (11-20), then strap the harness into position.
- (b) Support B. Secure support (11-30) to the IDG drain tube, then strap the harness into position.
- (c) Support C. Secure support (11-40) to the centre support tube, then strap the harness into position.
- (d) Support D. Secure support (11-40) to the left support tube, then strap the harness into position.
- (e) Support E. Secure support (11-50) to the LP shaft signal system pulley shroud (76-21-02/1-50) on the exhaust diffuser using wingscrew (11-60), then strap the harness into position.

3. High Energy Ignition Leads - Assembly on the Engine

## A. General.

- (1) For identification of parts used during assembly, refer to paragraph 1.C. and IPC 74-21-01.
- (2) Lubricate clamp nuts and bolts with lubricant 'B' (Ref.71-09-00, Table 501).

## B. Assembly of Ignition Leads to the High Energy (HE) Ignition Unit (Ref.Fig.525).

Assemble the two high energy ignition leads, (2-1) to the high energy ignition unit, located on the air intake casing, left-hand side of the engine, just above bottom centre line. Assemble connections dry and torque-tighten, Pre.SB.0L.593-74-8138-5 standard, between 10 and 15 lbf ft (13,6 and 20,3 N.m). SB.0L.593-74-8138-5 and SB.0L.593-74-9084-19 standard, between 20 and 25 lbf ft (27 and 34 N.m), using wrench (Tool 1664) and wire-lock.

OVERHAUL

## C. Assembly of Ignition Leads to the Engine (Ref.Fig.526).

## (1) Reference point 'A'.

Assemble the left-hand side lead only, to an existing bracket (72-01-04/1-300) on the anti-icing manifold adapter, located on the air intake casing, below the HE ignition unit, slightly above the engine bottom centre line. Pre SB.0L.593-74-9084-19 standard lead, retain with loop clamp (1-30), bolt (1-20) and clipnut (1-40). SB.0L.593-74-9084-19 standard lead, retain with clip (1-30), spacer (1-45), bolt (1-20) and clipnut (1-40). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (2) Reference point 'B'.

Assemble the right-hand side lead only, to an existing bracket (75-11-01/2-180) on the anti-icing manifold pipe to adapter. Pre SB.0L.593-74-9084-19 standard lead, retain with loop clamp (1-50) and existing nut (71-51-01/2-160) and bolt (71-51-01/2-170), which also retains the electrical harness. SB.0L.593-74-9084-19 standard lead, retain with clip (1-50) and existing nut (71-51-01/2-160) and bolt (71-51-01/2-170), which also retains the electrical harness. Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (3) Reference points 'C' and 'D'.

Assemble the left and right-hand leads to their respective positions on an existing bracket (72-22-01/4-210) at the air intake to LP casing joint flange, left-hand side of the engine, slightly above bottom centre line. Retain, with loop clamps (1-70), bolts (1-60) and clipnut (1-80). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

**NOTE:** When using SB.0L.593-74-9084-19 standard lead, position 'C' is not used.

ASSEMBLY

OVERHAUL

## (4) Reference points 'E' and 'F'.

Assemble the left and right-hand leads together to an existing bracket (72-22-01/4-140) located on the same flange as points 'C' and 'D'. Retain, with loop clamps (1-90) and existing nut (71-51-01/2-110) and bolt (71-51-01/2-120) retaining the electrical harness, left-hand side of the engine slightly above bottom centre line. Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (5) Reference point 'G'.

Assemble the left and right-hand leads together to an existing bracket (72-01-04/1-70), located on the oil scavenge tube joint flange that feeds the LP compressor front (No.1) bearing to left-hand gearbox. Retain, with loop clamp (1-120), bolt (1-110) and nut (1-100). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (6) Reference point 'H'.

(a) HE lead (Pre.SB.0L.593-74-8732-12). Locate an existing bracket (72-31-01/4-430) on the forward blow-off flange of the LP casing, near the bottom of the engine, carrying the LP compressor front (No.1) bearing oil feed and return, tubes, and electrical harness. Assemble the left and right-hand leads together and retain to the bracket with loop clamp (1-150), pillar bolt (1-160A) and nuts (1-130) and (1-170). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(b) HE lead (SB.0L.593-74-8732-12). Assemble the left and right-hand leads together and secure to existing bracket (72-31-01/4-430) with clamp (1-150), pillar bolt (1-160B), spacer (1-140) and nuts (1-130) and (1-170). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (7) Reference point 'J'.

Locate an existing bracket (72-31-01/5-360) on the rear blow-off flange of the LP casing near the bottom centre line, carrying the LP compressor front (No.1) bearing vent tube. Assemble the left and right-hand leads together and retain, with loop clamp (1-190), bolt (1-180) and clipnut (1-200). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

## (8) Reference point 'K'.

Locate an existing bracket (72-31-01/5-300) on rear blow-off flange of the LP casing near the bottom centre line, carrying the LP compressor front (No.1) bearing vent tube, the second stage fuel pump to recirculation valve and the electrical harness. Assemble the left and right-hand leads together and retain, with loop clamp (1-220), bolt (1-210) and clipnut (1-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

NOTE: Before securing the leads at the next clipping position, cross the lead so that the left-hand lead is now on the left-hand side of the engine and the right-hand lead is on the right-hand side looking forward.

## (9) Reference point 'L'.

Assemble the left and right-hand leads together to an existing bracket (72-31-01/6-330) on the LP casing rear flange. This bracket, facing forward, is located on the left-hand side of the engine just above the centre line. Retain with loop clamp (1-220), bolt (1-210) and clipnut (1-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (10) Reference point 'M'.

Locate an existing bracket (72-01-04/2-110) on the rear face of sump at the intermediate case, near bottom centre line, carrying the following tubes; LP compressor front (No.1) bearing vent, air starter drain and first stage pump to flowmeter. Assemble the left and right-hand leads together and retain, with, Pre SB.0L.593-74-9084-19 standard, loop clamp (1-220), bolt (1-210) and clipnut (1-230), SB.0L.593-74-9084-19 standard, clip (1-220), bolt (1-210) and clipnut (1-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (11) Reference point 'N'.

Locate an existing bracket (72-33-01/6-270) on the rear face of the intermediate case near bottom centre line, carrying the drains tank re-ingestion tube and the air supply to pressure seals tube. Assemble the left and right-hand leads together and retain with, Pre SB.0L.593-74-9084-19 standard, loop clamp (1-220), bolt (1-210) and clipnut (1-230), SB.0L.593-74-9084-19 standard, clip (1-220), bolt (1-210) and clipnut (1-230). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (12) Reference point 'P'.

Locate an existing bracket (72-33-01/4-230) on the HP case blow-off strap, carrying the following tubes: LP and HP compressor thrust (No.2 and 3) bearings cold vents, HP and LP turbine (No.4 and 5) bearings oil feed, reheat fuel supply, starter feed, drains tank re-ingestion. Assemble the left-hand lead, Pre SB.0L.593-74-9084-19 standard, with loop clamp (2-30), bolt (2-20) and nut (2-10), SB.0L.593-74-9084-19 standard with clip (2-30), bolt (2-20) and nut (2-10). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (13) Reference point 'Q'.

To the same bracket (72-33-01/4-230) as indicated at point 'P', assemble the right-hand lead, Pre SB.0L.593-74-9084-19 standard, with loop clamp (2-60), bolt (2-50) and nut (2-40), SB.0L.593-74-9084-19 standard with clip (2-60), bolt (2-50) and nut (2-40), together with an existing clamp securing the second stage pump fuel tube to the electric starter pump. Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (14) Reference point 'R'.

Assemble the left-hand lead to the unique point support tray (71-51-01/10-200) which retains the electrical harness. Assemble lead to left-hand side of tray, near front end with, Pre SB.0L.593-74-9084-19 standard, loop clamp (2-80), bolt (2-70) and clipnut (2-90), SB.0L.593-74-9084-19 standard with clip (2-80), bolt (2-70) and clipnut (2-90). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(15) Reference point 'T'.

Assemble the left-hand lead to the unique point support tray, (71-51-01/10-200) to the rear of point 'R' with, Pre SB.0L.593-74-9084-19 standard, loop clamp (2-80), bolt (2-70) and clipnut (2-90), SB.0L.593-74-9084-19 standard with clip (2-80), bolt (2-70) and clipnut (2-90). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(16) Reference point 'V'.

Assemble the left-hand lead to the unique point support tray mounting bracket (72-33-01/8-280) at the left-hand side, rear end, Pre SB.0L.593-74-9084-19 standard with loop clamp (2-80), bolt (2-70) and clipnut (2-90), SB.0L.593-74-9084-19 standard with clip (2-80), bolt (2-70) and clipnut (2-90). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(17) Reference point 'W'.

**CAUTION:** IF ASSEMBLING SB.0L.593-74-9084-19 STANDARD LEAD, REFER TO PARA.(18) BEFORE ASSEMBLING TRAY (2-150).

- (a) Assemble lead support tray (2-150), to the existing bracket (73-12-05/1-60) on fuel sprayer boss on delivery case and bracket (72-42-01/4-120) on the delivery case to combustion chamber outer casing, near bottom centre line. Retain tray, with bolts (2-140) and nuts (2-130). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (b) Assemble the left-hand lead on the tray, Pre SB.0L.593-74-9084-19 standard with loop clamp (2-110), bolt (2-100) and clipnut (2-120), SB.0L.593-74-9084-19 standard with clip (2-110), bolt (2-100) and clipnut (2-120). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

ASSEMBLY

sheema

(18) Reference point 'X'.

CAUTION: LEADS PRE AND TO THE STANDARD OF SB.0L.  
593-74-9084-19 ARE POSITIONED ON THE  
TRAY AT DIFFERENT POSITIONS.

Assemble the left-hand lead on the tray (2-150),  
Pre SB.0L.593-74-9084-19 standard with loop clamp  
(2-110), bolt (2-100) and clipnut (2-120), SB.0L.  
593-74-9084-19 standard with clip (2-110), spacer  
(2-155), bolt (2-100) and nut (2-130) which also  
locates bracket (72-42-01/4-120). Torque-tighten  
to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

(19) Reference point 'S'.

Assemble the right-hand lead to the unique point  
support tray (71-51-01/10-200) which retains the  
main electrical harness, located at the engine  
bottom centre line, below the delivery case. Assemble  
the lead to the right-hand side of the tray, near  
the front end, Pre SB.0L.593-74-9084-19 standard  
with loop clamp (2-180), bolt (2-160) and clipnut  
(2-190), SB.0L.593-74-9084-19 standard with clip  
(2-180), bolt (2-160) and clipnut (2-190). Torque-  
tighten to between 85 and 95 lbf in. (9,6 and 10,7  
N.m).

(20) Reference point 'U'.

To the unique point position, immediately to the rear  
of clipping point 'S', assemble the right-hand lead  
with loop clamp (2-180), bolt (2-160) and clipnut  
(2-190). Torque-tighten to between 85 and 95 lbf in.  
(9,6 and 10,7 N.m).

(21) Reference point 'Y'.

To an existing bracket (75-01-04/1-160), located at  
the HP casing cooling air duct, to the right-hand side  
of the engine bottom centre line, assemble the right-  
hand lead, with loop clamp (2-200) and existing nut  
(71-79-01/1-20), bolt (71-79-01/1-50) and washer  
(71-79-01/1-30) securing the retaining seal failure  
drain tube and IDG rupture tube.

ASSEMBLY

OVERHAUL

## (22) Reference point 'Z'.

To an existing bracket (75-01-04/1-170) located at the HP casing cooling air duct, assemble the right-hand lead to the rear of the last clipping point, Pre SB.0L.593-74-9084-19 standard with loop clamp (2-180), bolt (2-160) and clipnut (2-190), SB.0L.593-74-9084-19 standard with clip (2-180), bolt (2-160) and clipnut (2-190). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## (23) Reference point 'Ab'.

To an existing bracket (75-01-04/1-170) located at the HP casing cooling air duct and to the rear of the clamping point 'Z', assemble the right-hand lead, with loop clamp (2-180), bolt (2-160 Pre SB.71-1) (2-170 SB.71-1) and clipnut (2-190). Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

NOTE: When assembling lead to the standard of SB.0L.593-74-9084-19, the existing bolt (2-160 or 2-170) and clipnut (2-190) are utilised but the igniter lead is not attached.

## (24) Reference point 'Ac'.

To an existing bracket, (71-51-01/9-60), located on the rear flange of the delivery casing to the right-hand side of the engine bottom centre line which carries the electrical harness, assemble the right-hand lead, Pre SB.0L.593-74-9084-19 standard with loop clamp (2-200), SB.0L.593-74-9084-19 standard with clip (2-200), spacer (2-210) and existing nut and bolt already retaining the main electrical harness. Torque-tighten to between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## D. Assembly of Ignition Leads to Igniter Plugs. (Ref.Fig. 525).

Assemble the two ignition leads to their respective igniters in the combustion chamber outer casing. Assemble connectors dry, torque-tighten, Pre SB.0L.593-74-8138-5 standard, between 10 and 15 lbf ft (13,6 and 20,3 N.m). SB.0L.593-74-8138-5 and SB.0L.593-74-8138-5 standard, between 20 and 25 lbf ft (27 and 34 N.m) using wrench (Tool 1664) and wire-lock.

OVERHAUL

ENGINE ELECTRICAL HARNESS AND HIGH ENERGY IGNITION  
LEADS - TESTING

1. General

This section contains the test procedures to be carried out after the installation of the electrical harness prior to engine test and at other times at the discretion of the Quality Manager.

2. Test Procedure for Checking Electrical Harness

A. Engine Electrical Test Set (Tool 814).

- (1) The test set is designed to check all the electrical units by feeding into the free connectors of the engine electrical harness break point.
- (2) It is unnecessary to reset the meter between ranges as 'zeroing' is automatic.
- (3) Where necessary, refer to the Ground Equipment Manual TP.203/BR for adjustment procedures.

B. Equipment and Power Supply Required for Testing.

- (1) Engine electrical system test set (Tool 814).
- (2) Test set (Tool 2604) )
- (3) CO<sub>2</sub> aerosol spray ) See Para.2.J.
- (4) A.c. supply 115  $\pm$ 5 volts, 400  $\pm$ 4 Hz.
- (5) D.c. supply 28  $\pm$ 2 volts.

C. Cable Looms.

NOTE: Connector sockets X and WYZ on the test set are required only when testing nacelle mounted accessories and are not relevant to the Overhaul Manual.

- (1) The Test Set is designed to accept the harness direct from the engine except for cables G and H where the jumper cables must be used.

PRINTED IN ENGLAND

TN1132

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) The seven jumper cables (B, C, D, E, F, G and H) are provided for use when the engine is mounted in the aircraft.
- (3) A cable (J) is provided for connecting the HP shut-off valve to the test set. This cable divides into two connectors (one 'OPEN', one 'CLOSE').
- (4) The thermocouple lead (V) terminates in nine pairs of crocodile clips.
- (5) Secure cable (G) and (H) adapters to their respective jumper cables when required to correct the orientation of the connectors.
- (6) Four other cables are provided:
  - (a) Earth loop cable.
  - (b) Earth cable.
  - (c) 28 V supply cable.
  - (d) 115 V, 400 Hz supply cable.
- (7) Refer to Table 701 for the cable loom services.

D. Pre-test Procedure.

- (1) Before starting a test, check the insulation of the test set and cables as follows:
  - (a) Connect plugs G, H, J and V to their respective sockets (plug G to socket G) etc., also connect plugs B, C, D, E and F to their respective sockets where the test set jumper cables are to be used.
  - (b) Set all switches to 'OFF'. Switches 137 to 141 and 144 are centre off.
  - (c) Connect 115 V, 400 Hz supply and switch the a.c. supply switch 'ON'.

TN1133

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (d) Set the Meter Range Selector Switch (134) to "Insulation 200 V" range.
  - (e) Operate switches 1 to 126 and 136 in turn and ensure that the resistance meter pointer remains on "infinity".
  - (f) Switch the a.c. supply 'OFF'.
- (2) Connect up looms as follows:
- (a) Connect the engine harness connectors to the test set or jumper cables (Plug B into Socket B, Plug C into Socket C) etc.
  - (b) Connect the 'CLOSE' and 'OPEN' connectors on loom J to the appropriate connectors on the HP valve on the engine fuel system.
  - (c) Connect up 28 V d.c. supply cable.
  - (d) Plug green earth loop cable into the test set and attach crocodile clip to the engine casing.
  - (e) Connect earth cable between engine casing and test set frame.

E. Interline Insulation Tests (Ref.Fig.702).

- (1) General.
- (a) The interline insulation tests are arranged so that each line of the engine electrical harness coming through the harness break point is tested for insulation resistance in turn with all the other lines passing through the break point.
  - (b) Carry out the tests with all accessories fitted to the engine and with the air starter shut-off valve in the closed position.
  - (c) If a fault condition occurs while carrying out interline tests, the accessory or line involved is to be determined by referring to Fig.702.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Pre-test procedure.

Set switches as follows:

Switch 134 - Interline insulation  
D.c. supply switch - ON  
A.c. supply switch - ON  
All remaining test set switches 'OFF'  
All green 'OFF' lights - illuminated

(3) Operation of interline test panel.

NOTE: Interline insulation checks are not required between positions 86 to 124 on switches 129A and B, 130A and B and 131A and B. These positions are related to connector sockets X and WYZ and are only required when testing nacelle mounted accessories and are not relevant to the Overhaul Manual.

- (a) Set switch 127A to Position 1 ('OFF' light goes out) and set switch 127B to Position 1. The resistance meter should indicate 'short' (as self check).
- (b) Switch 127B is then switched from Position 1 to Position 29 in turn with a pause between positions. The interline insulation meter readings should be above 4 M ohms. Certain readings however will be less than 4 M ohms, and these are acceptable provided they meet the following:
  - (i) Identify the two components involved (Ref. Fig.702). Locate these components in Table 704 and 705 and add together the minimum insulation resistance values of the two components.
  - (ii) If the interline insulation reading is equal to or exceeds the sum of the resistance values previously calculated (Ref. sub-para.(b)(i)), then the interline resistance value is acceptable.

Switch 127B is then switched 'OFF'.

TN2450

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (c) Switch 128B is then switched to Position 30 (light out) and then on to Position 58, observing meter as previously indicated (Ref.sub-para.(b)). Switch 128B is then switched to 'OFF' (light on).
- (d) Switch 129B is then switched to Position 59 (light out) and then on to Position 87, observing meter as previously indicated (Ref.sub-para.(b)). Switch 129B is then switched to 'OFF' (light on).
- (e) Switch 131B is then switched to Position 117 (light out) and then on to Position 145, observing meter as previously indicated (Ref.sub-para.(b)). Switch 131B is then switched to 'OFF' (light on).
- (f) The line on switch 127A Position 1 has now been tested for insulation against line 2 to 145 on the B switches.
- (g) Set switch 127A to Position 2 and set switch 127B to Position 2. The resistance meter should indicate 'short' (as self check). Then switch B switches from Position 3 to Position 145 in turn, observing meter and leaving switches in the 'OFF' position when not in use.
- (h) Set switch 127A to Position 3 and set switch 127B to Position 3. The resistance meter should indicate 'short' (as self check). Then switch B switches from Position 4 to Position 145 in turn, observing meter and leaving switches in the 'OFF' position when not in use.
- (j) Repeat the previous operations until switch 131A reaches Position 145.
- (k) On completion of tests, ensure that interline switches (127-131) are in the 'OFF' (lights on) position. Switch a.c. supplies 'OFF' and switch 134 'OFF'.

OLYMPUS 593

MK.610-14-28

OVERHAUL

F. Accessory Resistance Tests.

(1) Connect the following cables:

- (a) Engine harness cables to test set (Tool 814) using jumper cables as required.
- (b) Cable V from the test set to the thermocouple terminals on the engine.
- (c) Cable J between test set and HP shut-off valve.
- (d) Supply cables.
- (e) Earth loop cable.
- (f) Earth cable.

(2) Set switches as follows:

Switches 127A to 131A	-	OFF) All lights on
Switches 127B to 131B	-	OFF)
Switch 132	-	OFF
Switch 134	-	OFF
Switch 136	-	OFF
Switch 137	-	Res. and Ins. test position
Switch 138	-	Res. and Ins. test position
Switch 140	-	OFF
Switch 142	-	OFF
Switch 143	-	OFF
115 V 400 Hz	-	OFF
28 V d.c.	-	ON

(3) Engine mounted accessory resistance tests.

Carry out tests detailed in Table 702 by the operation of circuit switches 1 to 126.

(4) Engine mounted a.c. actuator resistance tests.

- (a) Carry out tests detailed in Table 703 by varying the position of switch 136.

TN2521

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (b) On completion of the tests return switches 134 and 136 to 'OFF'.

G. Accessory Insulation Tests.

- (1) With cables connected as in paragraph 2.F.(1) set switches as follows:

Switches 127A to 131A	-	OFF)	All lights ON
Switches 127B to 131B	-	OFF)	
Switch 132	-	OFF	
Switch 134	-	OFF	
Switch 136	-	OFF	
Switch 137	-	Res. and Ins. test	position
Switch 138	-	Res. and Ins. test	position
Switch 140	-	OFF	
Switch 142	-	OFF	
Switch 143	-	OFF	
115 V 400 Hz	-	ON	
28 V d.c.	-	ON	

Earth loop lamp must be 'ON' when 50 V, 100 V and 200 V Ins. ranges are selected.

- (2) Engine mounted accessory insulation tests.

Carry out tests detailed in Table 704 operating switches 1 to 141 and varying position of switch 134.

- (3) Engine mounted a.c. actuator insulation tests.

- (a) Carry out tests detailed in Table 705 by varying position of switches 134 and 136.

- (b) Return switches 134 and 136 to 'OFF'.

- (4) Screens to earth insulation tests (Ref. Table 706).

- (a) Set switch 134 to 200 V range. Operate switch 133 and check that the meter indicates open circuit. If a short circuit is indicated, identify the faulty screen as follows:

PRINTED IN ENGLAND

TN3783

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (i) Rotate switch 132 from 1 to 22 pausing to observe the meter reading which should be above 2M ohms.
- (ii) Where a short circuit is indicated, identify the faulty screen by reference to the switch position in Table 706.
- (b) Select switch 132 to position 23 and check that the meter indicates a short circuit.
- (c) Return switch 132 to 'OFF' (light ON) and switch 134 to 'OFF'.

#### H. Accessory Functional Tests.

- (1) With cables connected as in paragraph 2.F.(1), set switches as follows:

Switches 127A to 131A	-	OFF) Lights ON
Switches 127B to 131B	-	OFF)
Switch 132	-	OFF
Switch 134	-	OFF
Switch 136	-	OFF
Switch 137	-	Function Test Position
Switch 138	-	Function Test Position
Switch 140	-	OFF
Switch 142	-	OFF
Switch 143	-	OFF
115 V, 400 Hz supply	-	ON
28 V d.c. supply	-	ON

- (2) Engine mounted solenoid control functional tests.

Carry out tests detailed in Table 707.

- (3) Engine mounted a.c. actuator functional tests.

- (a) Carry out tests detailed in Table 708.
- (b) Return switches 140 and 142 to 'OFF'.

TN3791

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

(4) Igniter functional tests.

WARNING: BEFORE COMMENCING THE FUNCTIONAL TESTS ON IGNITERS, ENSURE THAT ALL PERSONNEL ARE CLEAR OF THE ENGINE. A MINIMUM OF 20 MINUTES MUST ELAPSE AFTER ANY MOTORING CYCLE, FUEL FUNCTIONAL TEST ETC. HAS TAKEN PLACE. THE ENGINE MUST BE THOROUGHLY DRAINED OF FUEL.

(a) Carry out functional tests as detailed in Table 709.

(b) Return switch 143 to 'OFF'.

(5) Air starter valve functional test.

(a) Carry out functional test as detailed in Table 710.

(6) Return all switches to 'OFF', remove all cable looms and replace all plug protection caps and blanks removed from the engine and test equipment.

J. Jet Pipe Temperature Thermocouple Harness Functional Check.

(1) The jet pipe temperature thermocouple harness can be functionally tested using test set (Tool 2604) and a CO<sub>2</sub> aerosol spray as follows:

(a) Check condition of batteries.

(b) Connect test set to jet pipe temperature thermocouple test socket (if this is unavailable, use alternative test lead which incorporates crocodile clips to attach to each thermocouple circuit).

(c) Switch test set 'ON' and adjust datum control to give mid-position on each of the three meters.

(d) Place flexible spout of aerosol into hole in thermocouple and give one squirt of CO<sub>2</sub> spray.

(e) The correct function of the thermocouple is indicated by a steady deflection of the three test set meter.

PRINTED IN ENGLAND

TN17344

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

(f) Repeat para.(d) and (e) for each thermocouple in turn.

(g) Switch test set 'OFF' and disconnect test leads.

K. Installation of Harness Transportation Details  
(Ref.Fig.701).

(1) General.

To prevent damage during transportation the harness is secured by five harness supports and a mounting plate assembly secured to the engine.

(2) Install mounting plate.

(a) Secure mounting plate to brackets with two wingscrews.

(b) (Post Mod.OL.8180 incorporated). Secure spring clip to bracket with a nut, washer and bolt. Torque-tighten to between 25 and 30 lbf in. (2,8 and 3,4 N.m).

(c) Connect the seven plugs to their respective mating dummy receptacles.

(3) Install harness supports.

(a) Support A. Strap harness to the electrical loom and secure the harness to the clip with a wing-screw.

(b) Support B. Strap the harness to the electrical loom and tube.

(c) Support C. Strap the harness to the electrical loom and clip around the tube.

(d) Support D. Strap the harness to the electrical loom and clip around the tube.

(e) Support E. Strap the harness around the electrical loom and secure to tube with a clip and wingscrew.

ELECTRICAL HARNESS AND HIGH ENERGY (HE) IGNITION LEADS  
- SPECIAL TOOLS, FIXTURES AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Tables 1001 and 1002 are those required for the removal and installation and testing of the electrical harness on the engine.
- B. The tools are listed in their order of usage and the Tool Ref.No. is the number quoted in the text. Tools marked with an \* are used in more than one aspect of assembly.
- C. The tools have been illustrated in order of usage, but tools listed in more than one aspect of assembly or disassembly will be illustrated once only.

## OLYMPUS 593 OVERHAUL MANUAL

TEMPORARY REVISION No.71-506

Insert in chapter 71-00-03 Engine Despatch facing page 501

### REASON FOR ISSUE:

To delete a requirement at BEOL for British Airways' Engines only, to perform introscope inspections, C of G check and engine weighing at the engine despatch stage. (MRA 66).

### PREPARE ENGINE FOR DESPATCH.

#### 1. General.

Add the following:

F. Engine despatch procedures sub-para's. 2. E. and 2. H. (Introscope Checks) and 7. G. (C of G check and engine weighing) are not required on British Airways' Engines as a routine following engine test.

If occasions arise where these checks are considered necessary they will be stated as a specific BEOL history sheet requirement.

OVERHAUL

## PREPARE ENGINE FOR DESPATCH

### 1. General

- A. Prior to commencing engine despatch, refer to 72-09-00 Assembly for general information.
- B. During the despatch procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. nuts, bolts, washers, vanes, spacer, disks etc. An item will be identified as bolt (1-10), the 1 referring to the I.P.C. Fig.No., and the 10 referring to the Item No. Where items from any other breakdown are introduced, the full breakdown numbers will be quoted e.g. bolt (72-51-03/1-90).
- C. Throughout the text special tools are quoted by their Ref. No. e.g. (Tool 1234). For a complete list of tooling required for the engine despatch, and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Tables 1002 to 1005.
- D. This chapter details the work necessary for preparing the engine for despatch after final testing and includes final inspection of the engine.
- E. The engine may be received from test with slave accessories attached. Where necessary the procedures are detailed for the removal of slave accessories along with the subsequent assembly of the engines own components.

### 2. Intrascopes Checks and Despatch Procedures

#### A. Receive Engine from Test.

- (1) On receipt of engine from test carry out the following inspection checks.
  - (a) Check engine test records for:
    - (i) Engine acceptance.
    - (ii) Fuel system inhibited.
    - (iii) Engine filters checked and found satisfactory.

ENGINE DESPATCH

**71-00-03**

Page 501

Aug 11/75

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

- (b) Log the following data in inspection records.
    - (i) Engine running time.
    - (ii) Reheat running time.
    - (iii) Number of engine starts.
    - (iv) Number of reheat 'light ups'.
  - (c) Record, on the appropriate work sheet, any work that has not been completed and not required for test as detailed in the engine build sheets and any work for rectification as detailed in engine test records. This work is to be completed during the despatch procedures and cleared in final inspection.
  - (d) Accept the engine for intrascope check.
- B. Assemble Engine to Mobile Engine Stand (Tool 1266) (Ref.Fig.501).
- (1) Assemble the lifting equipment (Tool 2501) to the lifting brackets on the engine by inserting two quick release pins at the intermediate case and HP compressor case flange and by inserting two quick release pins at the delivery case and combustion chamber outer case (CCOC) flange.
  - (2) Support the engine, release and remove the pedestal clamps from the trunnion brackets on the engine transportation trolley.
  - (3) Disconnect the engine supports from the LP compressor casing and lift the engine clear of the trolley.
  - (4) Do not remove the trunnion adapters (Tool 1177 and 1193) from the engine trunnions.
  - (5) Adjust the lifting equipment where necessary to set the engine in a vertical plane by turning the handnut and in the horizontal plane by turning the handle.
  - (6) Position the engine over the mobile engine stand (Tool 1266). Assemble the brackets (Tool 1083 and 1756) to the LP compressor casing front flange. Assemble the support plate (Tool 808) to the brackets.

MK.610-14-28  
OVERHAUL

- (7) Lower the engine carefully until the trunnion adapters locate in the trunnion locations and secure the support plate to the mounting bracket (Tool 261) at the front of the engine with bolt.
- (8) Secure the trunnion adapters with the pedestal clamps.
- (9) Remove lifting equipment.

C. Clean Air Intake and Exhaust Diffuser.

- (1) Release the clamps and remove the slave transportation blank from the air intake.
- (2) Clean the inlet guide vanes and all accessible LP compressor rotor and stator blades using an approved cleaning solution, i.e. tiket or kerosene.
- (3) Dry the air intake thoroughly using suitable fluff-free cloths.
- (4) Temporarily reassemble the transport blank.
- (5) Release the clamps and remove the slave transportation blank from the exhaust diffuser.
- (6) Clean the exhaust diffuser using an approved cleaning solution, i.e. tiket or kerosene and remove all traces of exhaust deposits.
- (7) Dry the exhaust diffuser thoroughly using suitable fluff-free cloths.
- (8) If the engines own reheat spray ring and TJ harness are fitted clean with an approved cleaning solution, i.e. tiket or kerosene.
- (9) Dry the reheat spray ring and TJ harness thoroughly using suitable fluff-free cloths.
- (10) Temporarily reassemble the slave transport blank.

D. Prepare Engine for Intrascopie Check.

- (1) Assemble the HP hand turning equipment (Ref.72-09-01).

TN29537

ENGINE DESPATCH

71-00-03

Page 504  
Aug 11/75

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Using the HP hand turning equipment carry out a freedom of rotation check.

CAUTION: DURING FREEDOM OF ROTATION CHECKS ENSURE ENGINE TURNS FREELY, ENSURE THAT ENGINE TURNING TORQUE DOES NOT EXCEED 350 TO 375 LBF IN. (39,5 TO 42,3 N.m).

- (3) Remove the front and rear engine blanks and carry out the following visual inspection checks for signs of damage and cracks. Check for cleanliness.

- (a) Inspect the entry guide vanes.
- (b) Inspect the stage 1 LP Compressor rotor blades and stator vanes (Ref.72-09-03 Inspection/Check).

NOTE: Any evidence of damage on the stage 1 LP compressor rotor blades and stator vanes, within the acceptance standards detailed in 72-09-03 Inspection/Check, must entail further detailed internal examination of all compressor rotor blades.

- (c) Inspect the trailing edges of the LP turbine blades.
- (d) Inspect the LP turbine blade 'Z' gaps to ensure that the stellite pads are in the correct position and of the right standard.
- (e) Inspect the exhaust diffuser and TJ harness.

**E. Intrascopes Checks - Rotating Assembly.**

- (1) Conduct intrascopes checks at the following locations in accordance with (Ref.72-09-03 INSPECTION/CHECK).
  - (a) HP compressor 1st stage rotor blades trailing edge.
  - (b) HP compressor 2nd stage rotor blades leading edge.
  - (c) HP compressor 2nd stage rotor blades trailing edge.
  - (d) HP compressor 3rd stage rotor blades leading edge.
  - (e) HP turbine blades trailing edge.
  - (f) LP turbine leading edge.

OVERHAUL

- (2) If damage is discovered when inspecting the HP compressor, then further intrascope checks of the HP compressor 4th, 5th, 6th and 7th stages will be necessary in accordance with (Ref.72-09-03 INSPECTION/CHECK).
- (3) Record damage in the engine despatch inspection sheets.
- (4) Remove the HP hand turning equipment (Ref.72-09-01 ASSEMBLY).
- (5) Clear the engine for fitting to the rollover stand.

F. Carry Out Positional Checks of Overboard Vents and Ducts (Ref.Fig.502, sheet 1).

NOTE: The positional checks are required to ensure that the overboard vents and ducts are correctly positioned after engine test.

- (1) Assemble the front gauging bracket (Tool 1760) to the engine and check the fuel heater overboard ducts and the oil tank vent.

NOTE: The checking gauge must align with the overboard duct or overboard outlet being checked, the gauge will locate flush with the front gauging bracket (Tool 1760) without undue force where alignment is correct.

- (a) Remove the blanks from the fuel heater overboard duct and the oil tank overboard outlet.
- (b) Remove the two nuts and plate from the front gauging bracket.
- (c) Locate the gauging bracket to the left-hand support bracket (Tool 1756) on the inlet guide vane and LP compressor case flange.
- (d) Assemble the gauging bracket to the two brackets on the delivery casing and CCOC flange and secure with the bolts provided.
- (e) Using the checking gauge (Tool 1761) check the position of the fuel heater overboard duct.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (f) Using the checking gauge (Tool 1762) check the position of the oil tank overboard outlet.
  - (g) Reposition the overboard ducts or overboard outlets where alignment cannot be achieved and recheck where necessary.
  - (h) Remove the gauges and front gauging bracket from the engine.
  - (j) Assemble the plate to the front of the gauging bracket and place the gauges and bracket in their container (Tool 1757).
  - (k) Assemble the blanks to the fuel heater overboard duct and the oil tank overboard outlet.
- (2) Check the LP and HP compressor thrust bearings, the LP and HP turbine bearings, HP compressor rear labyrinth and the drains tank overboard vents (Ref. Fig.502, sheet 2).

NOTE: The checking gauge must align with the vent or overboard outlet being checked, the gauge can be screwed down flush with the rear gauging bracket (Tool 1763) without undue force where alignment is correct.

- (a) Remove the blanks from the LP and HP compressor thrust bearings, the LP and HP turbine bearings, HP compressor rear labyrinth and the drains tank overboard vents.
- (b) Assemble the rear gauging bracket (Tool 1763) to the three brackets on the delivery case and CCOC flange and the single bracket on the CCOC and exhaust diffuser flange.
- (c) Secure the gauging bracket with the bolts and nuts provided.
- (d) Using the gauge (Tool 1764) with the rear gauging bracket, check the position of LP and HP compressor thrust bearing cold vent outlet.
- (e) Using the gauge (Tool 1764) with the rear gauging bracket, check the position of LP and HP turbine bearing cold vent outlet.

- (f) Using the gauge (Tool 1765) with the rear engine bracket, check the position of the HP compressor rear labyrinth left and right-hand vents.
  - (g) Using the gauge (Tool 1766) with the rear engine bracket, check the position of the drains tank overboard outlet.
  - (h) Reposition the vent tubes or overboard vents where alignment cannot be achieved and recheck where necessary.
  - (j) Remove the gauges and the rear gauging bracket from the engine and place the gauges and bracket in their container (Tool 1150).
  - (k) Reassemble the blanks to the overboard vents.
- G. Assemble Engine to Rollover Stand (Ref.Fig.503).
- (1) Prepare the rollover stand.
    - (a) Set the motorized rollover stand (Tool 94) in the upright position on its base rollers and lock the rollover rings with the retaining pins.
    - (b) Remove the eight nuts and bolts securing the top section of the front rollover ring to the frame, then remove the top section of the ring.
    - (c) Remove the eight nuts and bolts securing the top section of the rear rollover ring to the frame, then remove the top section of the ring.
    - (d) Ensure that the front links are assembled to the frame.
  - (2) Locate the engine in the rollover stand (Ref.Fig.503).
    - (a) Assemble the lifting equipment (Tool 2501) to the lifting brackets on the engine by inserting two quick release pins at the intermediate case and HP compressor case flange and by inserting two quick release pins at the delivery case and CCOC case flange (Ref.Fig.501).

MK.610-14-28  
OVERHAUL

- (b) Support the engine, then release the front engine supports (Tool 261) and remove the trunnion pedestal clamps from the mobile engine stand.
- (c) Raise the engine from the mobile engine stand. Remove the trunnion adapters from the engine trunnions and return to the transportation trolley, then remove the support plate (Tool 808) and two brackets (Tools 1083 and 1756) from the engine.
- (d) Slide the rollover stand trunnion adapters over the engine trunnions.
- (e) Position the engine over the rollover stand and lower carefully into the stand until the trunnion bushes engage with the trunnion housings.
- (f) Assemble the top section of the front rollover ring. Adjust the two front engine suspension spigots on the front ring to locate the lower lifting points on the LP compressor case and air intake flange. Insert the pins provided then, using the alignment bar (Tool 1023) where necessary, secure the ring with eight nuts and bolts.
- (g) Assemble the top section of the rear rollover ring using the alignment bar (Tool 1023) where necessary and secure with eight nuts and bolts.
- (h) Secure the trunnion clamps in position with the swing bolts and nuts.
- (j) Remove the lifting equipment.
- (3) Drain oil tank (Ref.Fig.504).
- (a) Position a container, with a capacity adequate for a quantity of 25 litres, below the oil fill/drain coupling.
- (b) Detach the fill/drain coupling pressure cap. Turn the locking ring and pull downwards to release the locking balls of the quick release coupling.

ENGINE DESPATCH

71-00-03

Page 513

Jan 2/80

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (c) With the end of the drain tube (Tool 3009) in the container, engage the tube adapter with the coupling to open the valve.
- (d) When oil ceases to drain from the tank, disconnect the drain tube and replace the pressure cap. Ensure that the locking ring is in the locked position.
- (e) Remove the screwed plug (79-11-01/1-350) from the base of the tank and drain the remaining oil.
- (f) With a Corrujoint seal (79-11-01/1-360) assembled to the plug, apply lubricant 'B' and screw the plug into its location. Torque-tighten the plug between 230 and 250 lbf in. (26 and 28,2 N.m) and wire-lock to the oil tank contents transmitter and overfull warning switch retaining bolt.

#### H. Intrascope Checks - Static Assembly.

- (1) Conduct intrascope checks at the following locations of the CCOC in accordance with (Ref.72-09-03 INTRASCOPE CHECK).
  - (a) 16 Vaporizers of the combustion chamber.
  - (b) Front fairing of combustion chamber.
  - (c) Inner and outer flame tubes of the combustion chamber.
  - (d) HP turbine stator segments leading edge.
- (2) If damage is discovered when inspecting the combustion chamber then further intrascope checks will be necessary of the outer primary zone and a more detailed check of the vaporizers in accordance with (Ref.72-09-03 INTRASCOPE CHECKS).
  - (a) Record all damage in the engine despatch record sheets.

#### J. Remove Fuel Filter Element.

NOTE: The fuel filter and filter element are under breakdown 73-14-01 and the IPC references in this para are from 73-14-01.

ENGINE DESPATCH

OVERHAUL

- (1) Drain the engine fuel system (Ref.Fig.505).
  - (a) Utilise the air bleed valve near the distribution block, the fuel filter and fuel inlet drain valves and drain the system upstream of the FCU using drain tool (Tool 1783).
  - (b) When fuel ceases to drain, remove the drain tubes and close the bleed valve.

- (2) Remove the filter element (Ref.Fig.506).

- (a) Remove two bolts (1-150) and plate (1-160) securing the steady bracket (1-170) to the bracket at main oil pump flange.
- (b) Remove the four bolts (1-40) and washers (1-50) securing the steady bracket to the filter, then remove the bracket and locating plate (1-60).

NOTE: Refer to Vendors Overhaul Manual (Ref. 73-14-01) for identification of items mentioned in para.(c), (d) and (e).

- (c) Support the filter cover unit, then remove the eight bolts and one bolt and the locking plate.
- (d) Withdraw the cover unit and the seal plate tilting unit as necessary to obtain withdrawal clearance.
- (e) Locate the extractor tool (Tool 944) on the filter housing, to secure the extractor to the housing by three of the existing bolts, then screw the extractor into the filter element (2-20).
- (f) Screw in on the extractor handle and withdraw the filter element to the maximum extent of the extractor, detach the extractor from the housing and withdraw the filter element fully.
- (g) Detach the filter element from the extractor, remove the seal rings (2-10) from the filter element, then place the element in the container (Tool 801).
- (h) Assemble temporary blanks to the filter housing.

ENGINE DESPATCH

**71-00-03**

Page 517  
Jan 2/80

OLYMPUS 593

OVERHAUL

(3) Clean and pressure test the filter element in accordance with the vendors manual (Delaney Gallay). On completion of the pressure test re-assemble the filter element as detailed in para.(4).

(4) Assemble filter element (Ref.Fig.506).

(a) Assemble the sealing rings (2-10) to the filter element (2-20).

(b) Screw assembly tool (Tool 944) into the end of the filter element.

NOTE: The filter element comprises a screwed thread at one end only.

(c) Locate the filter element in the filter housing and push the element squarely into the housing until the assembly tool abuts the filter housing.

NOTE: Refer to Vendors Overhaul Manual (Ref. 73-14-01) for identification of items mentioned in para.(d), (f), (g) and (j).

(d) Secure the assembly tool to the filter housing with the three existing bolts. Complete the location of the filter element in the housing by screwing in the tool.

(e) Unscrew the assembly tool from the filter element then release the assembly tool from the filter housing.

(f) Apply lubricant 'B' to the seven bolts and one bolt.

(g) Assemble a new seal plate to the filter cover unit.

(h) Align the filter cover and seal plate with the attachment bolt holes ensuring the locating pin is engaged.

(j) Support the cover unit and engage the locking plate with seven attachment bolts and one attachment bolt.

TN32105

OVERHAUL

- (k) Lightly tighten the bolts to retain the mating faces in contact.
- (l) Assemble the steady bracket (1-170) and locating plate (1-60) to the cover and retain in position with four washers (1-50) and bolts (1-40), lightly tightened.
- (m) Secure the steady bracket to the bracket attached to the main oil pump flange with the plate (1-160) and two bolts (1-150), manipulating the bracket as necessary to align serrations.
- (n) Torque-tighten the cover unit and bracket attachment bolts between 80 and 90 lbf in. (9,0 and 10,2 N.m) ensuring that the cover unit bolts are evenly tightened in diametral pairs.

### 3. Remove Slave Test Equipment from Engine

NOTE: The air starter should have been removed as detailed in 72-00-26, TESTING.

#### A. Remove the Main and Standby Slave Hydraulic Pumps.

NOTE: The slave main and standby hydraulic pumps attachment items are under breakdown 72-63-01 and the I.P.C. references in this para. are from 72-63-01 except where specifically detailed.

- (1) Remove the slave main hydraulic pump (Ref.Fig.509).
  - (a) Using universal spanners (Tool 1619 to 1624) remove the electrical connection from the main slave hydraulic pump.
  - (b) Remove the rim clenching clamp assembly (6-10) securing the pump to the right-hand gearbox.

CAUTION: REMOVE NUT (6-20) ON OUTER EYE-BOLT (6-80) OF CLAMP BEFORE ATTEMPTING TO RELEASE TORQUE ON INNER EYE-BOLT (6-80). ENSURE THAT EACH NUT IS RETAINED WITH ITS RESPECTIVE EYE-BOLT.

OVERHAUL

- (c) Remove the pump from the gearbox.
  - (d) Remove the retaining ring securing the splined shaft to the main hydraulic pump drive shaft.
  - (e) Withdraw the (slave) splined shaft with attached seal rings, then reassemble the retaining ring to the drive shaft and return the slave items to the test equipment store.
  - (f) Assemble a temporary blank to the pump location on the right-hand gearbox.
- (2) Remove the slave standby hydraulic pump (Ref.Fig.507).
- (a) Using universal spanners (Tool 1619 to 1624) remove the electrical connection from the standby slave hydraulic pump.
  - (b) Remove the rim clenching clamp assembly (6-130) securing the pump to the right-hand gearbox.

CAUTION: REMOVE NUT (6-140) ON OUTER EYE-BOLT (6-200) OF CLAMP BEFORE ATTEMPTING TO RELEASE TORQUE ON INNER EYE-BOLT (6-200). ENSURE THAT EACH NUT IS RETAINED WITH ITS RESPECTIVE EYE-BOLT.

- (c) Remove the pump from the gearbox.
- (d) Remove the retaining ring securing the splined shaft to the standby hydraulic pump drive shaft.
- (e) Withdraw the splined shaft with attached seal rings, then reassemble the retaining ring to the drive shaft and return the slave items to the test equipment store.
- (f) Assemble a temporary blank to the pump location on the right-hand gearbox.

NOTE: The rim clenching clamp assemblies are engine components and must be retained with the engine.

- (g) Return the slave hydraulic pumps and splined shafts to test equipment store.

B. Remove the Slave Pressure Blank from the Gearbox IDG Location (Ref.Fig.508).

NOTE: The test blank attachment items are under breakdown 72-63-01 and the IPC references in this paragraph are from 72-63-01 except where specifically detailed.

- (1) Unscrew and remove the bolt (8-10) and spherical washer (8-20) from the nut (8-110) and mounting bracket (8-160).
- (2) Use the approved drift against the anvil and drive the coupling in the direction that will release the threads and disengage the coupling.
- (3) Remove the test blank. If the blank B.488388 (72-00-25, Tool 3070) is installed, the splined shaft (72-63-03/1-40) will have been removed. Assemble the splined shaft to the IDG drive shaft as detailed in para.4.A.
- (4) Assemble the bolt and spherical washer to the QAD retaining bracket and nut. Restrain the QAD coupling to prevent movement.
- (5) Temporarily blank the IDG location on the right-hand gearbox.
- (6) Examine Corruplus seal (8-30) for serviceability and retain with engine.

C. Remove the Slave TRA Elbow (Ref.Fig.508).

- (1) Remove the slave TRA elbow from vane No.2 or 8 on the delivery casing.
  - (a) Remove the 10 bolts (72-34-00/3-230), and the slave elbow from vane No.2 or 8 of the delivery casing.
  - (b) Assemble a suitable temporary blank to the vane.

NOTE: Installation of the air duct vane cover is detailed in para.4.B.

- (c) Retain the bolts with the engine.

#### 4. Install IDG Splined Shaft and Vane Cover

##### A. Install the Integrated Drive Generator (IDG) Splined Shaft (Ref.Fig.509).

NOTE: The IDG splined shaft items are under breakdown 72-63-03 and the IPC references in this para. are from 72-63-03.

- (1) Remove the bolt (1-10) and the retainer sleeve (1-20) from the IDG drive shaft in the right-hand gearbox.
- (2) Assemble the seal rings (1-30) to the splined shaft (1-40) then assemble the shaft to the drive shaft.
- (3) Apply lubricant 'A' to the bolt (1-10) and assemble with the shaft retainer sleeve (1-20) to the drive shaft to retain the splined shaft.
- (4) Torque-tighten the bolt to between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Temporarily blank the IDG location on the right-hand gearbox.

##### B. Install the Air Duct Vane Cover (Ref.Fig.508).

- (1) Apply lubricant 'C' to the ten bolts (72-34-00/3-230).
- (2) Assemble the cover (72-34-00/3-220) to vane 2 or 8 of the HP compressor diffuser case and retain with the bolts and cupwashers (72-34-00/3-240).

NOTE: The cover will be assembled to vane 2 or 8 depending on the slave TRA elbow location.

- (3) Torque-tighten the bolts to 100 lbf in. (11,5 N.m) then lock the cupwashers at vane 2 and 8.

#### 5. Inspection Clearance Checks

##### A. Carry Out Inspection of Engine Exterior, Components Removed and Re-assembled and Tube Clearance Checks.

- (1) Check items disturbed during test as detailed in test records.

- (a) Check for correct assembly.
- (b) Check effectiveness of locking devices.
- (2) Carry out the following checks.
  - (a) Inspect main and auxiliary oil pumps pressure relief valve caps.
  - (b) Magnetic plugs and filter cover.
  - (c) Igniter leads.
  - (d) Stage 1 fuel pump seal drain tube.
  - (e) Stage 2 turbo pump seal drain tube.
  - (f) Plug in pressure filter cover on right-hand gearbox.
- (3) Inspect heat shields for fouls, cracks and sharp corners at the following locations.
  - (a) CCOC heat shields left and right-hand sections.
  - (b) Rear cover heat shields left and right-hand sections.
  - (c) Exhaust diffuser panels 1 to 10.
  - (d) Exhaust diffuser auxiliary shields.
- (4) Inspect the reheat fuel pipe for damage and fretting and ensure that a red line is marked on the nut and fittings with heat resistant paint.
- (5) Check that all the intrascope port plugs and blanks are correctly fitted and wire-locked.
- (6) Check the engine exterior for cleanliness and damage.

(7) Check the clearances between the tubes and accessories and the engine (Ref.Fig.510).

- (a) Ensure that an installed clearance exists between adjacent tubes and components. Comply with the clearance limits stated in Table 501 for specific tubes and components and ensure that the clearance between all other adjacent tubes and components is not less than 0.20 in. (5 mm). For additional data on location of tubes and accessories, refer to 71-00-01, Assembly Stage 1, Figure 501.

TUBE/COMPONENT	ADJACENT TUBE/COMPONENT	MINIMUM CLEARANCE
2. Intermediate case drain tube	Rear bolt securing pulse probe housing attachment flange to intermediate case	0.050 in. (1,270 mm)
3. Fuel tube, recirculating valve to second stage pump	Bracket on LP compressor case rear blow-off flange front face	0.080 in. (2,032 mm)
4. Main oil tank	LP compressor case at any radial position	0.070 in. (1,778 mm)
5. Anti-icing manifold	Air intake at any position	0.030 in. (0,762 mm)
6. Fuel heater air tube	Underside of left-hand engine trunnion	0.100 in. (2,540 mm)
7. Connector on LP and HP compressor thrust bearings oil feed tube	Intermediate case air seals supply tube support bracket on LP compressor case	0.050 in. (1,270 mm)

B. Assemble Oil Drain Tube (Ref.Fig.511).

NOTE: The oil drain tube to be assembled is the rear section of the IDG cooler rupture valve to the overboard spill at the drains tank.

NOTE: The IDG oil drain tube items are under breakdown 71-79-01 and the IPC references in this para. are from 71-79-01.

- (1) Apply lubricant 'A' to the union threads on the tube (1-160) and lubricant 'B' to the bolts (1-40-50-120).
- (2) Loosely assemble the tube (1-2160) to the overboard spill adapter at the drains tank.

OVERHAUL

- (3) Assemble the tube loop clamp assembly (1-10) to the tube and attach to the CCOC flange tube support bracket with a nut (1-20), washer (1-30) and bolt (1-40).
- (4) Assemble the tube loop clamp assembly (1-10) to the tube and attach to the support bracket on the HP delivery casing cooling air duct with a nut (1-20), washer (1-30) and bolt (1-50).
- (5) Assemble the tube loop clamp assembly (1-10) to the tube and attach to the support bracket on the HP compressor rear labyrinth vent duct with a nut (1-100), washer (1-110) and bolt (1-120).
- (6) Torque-tighten all tube clamp bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (7) Using adapter (Tool 908) and spanner torque-tighten the tube union nut between 280 and 310 lbf in. (31,6 and 35,0 N.m).
- (8) Wire-lock the union nut to overboard spill adapter then assemble a blank to the tube end.

#### 6. Rig Test and Final Installation of Main Electrical Harness

##### A. Prepare for Rig Test.

- (1) Inspect electrical system and check engine test records concerning the electrical system, noting any items that have been disturbed.
- (2) Remove all blanks from the harness main connections.

##### B. Use of Test Set (Tool 814).

- (1) It is unnecessary to reset the meter between ranges as zeroing is automatic. Where necessary refer to the Ground Equipment Manual TP 203/BR for adjustment procedures.
- (2) Cable looms.

NOTE: Connector sockets X and WYZ on the test set are required only when testing nacelle mounted accessories and are not relevant to the Overhaul Manual.

- (a) The test set (Tool 814) connects direct to the engine harness connectors, except connector G and H which require the test set jumper cables to be used.

- (b) Where cable G and H are supplied with cable adapters, connect the adapters to the respective jumper cables to adapt orientation of the connectors at the engine end.
- (c) Cable J connects the HP shut-off valve to the test set and divides into two connectors, one for the start solenoid valve connection (OPEN) and one for the shut-off solenoid valve connection (CLOSE).
- (d) The thermocouple test lead (V) terminates in nine pairs of crocodile clips.
- (e) The two power supply cables connect to their respective power supplies, that is:
- (i) A.C. supply of  $115 \pm 5$  V,  $400 \pm 4$  Hz.
  - (ii) D.C. supply of  $28 \pm 2$  V.
- (f) An earth loop cable and earth cable are provided.
- (g) The cable loom services are detailed in Table 502.
- (3) Check insulation of the test set and cables.
- (a) Connect plugs G, H, J and V to their respective sockets (plug G to socket G) etc., also connect plugs B, C, D, E and F to their respective sockets where the test set jumper cables are to be used during test.
  - (b) Set all switches to OFF. Switches 137 to 141 and 144 are centre off.
  - (c) Connect the 115V, 400 Hz supply and select the a.c. supply switch ON.
  - (d) Set the meter range selector switch (134) to Insulation 200V range.
  - (e) Operate switches 1 to 126 and 136 in turn and ensure that the resistance meter pointer remains on INFINITY.
  - (f) Select the a.c. supply switch OFF.

ENGINE DESPATCH

**71-00-03**

Page 535

Jan 2/80

MK.610-14-28  
OVERHAUL

(4) Connect the looms.

- (a) Connect the engine harness connectors to the test set or jumper cables (Plug B to Socket B, Plug C to Socket C) etc.
- (b) Connect the 'CLOSE' and 'OPEN' connectors on loom J to the appropriate connectors on the HP valve on the engine fuel system.
- (c) Connect the 28 V d.c. supply cable.
- (d) Plug the green earth loop cable into the test set and attach the spring clip to the engine casing.
- (e) Connect the earth cable to the engine casing and test set frame.

C. Interline Insulation Test.

(1) General.

- (a) The interline insulation tests are arranged so that each line of the engine electrical harness coming through the harness break-point is tested for insulation resistance in turn with all other lines passing through the breakpoint.
- (b) Carry out the tests with all accessories fitted to the engine and with the air starter shut-off valve in the closed position.
- (c) If a fault condition occurs while carrying out the tests, the accessory or line involved can be determined by referring to Fig.512.

(2) Before proceeding to operate the inter-line test panel, set the switches as follows:

Switch 134	- INTER-LINE INSULATION
D.C. Supply switch	- ON
A.C. Supply switch	- ON
All remaining test set switches	- OFF
All green OFF lights	- ILLUMINATED

IN17794

ENGINE DESPATCH

MK.610-14-28  
OVERHAUL

(3) Test procedure.

NOTE: Interline insulation checks are not required between positions 86 to 124 on switches 129A and B, 130A and B and 131A and B. These positions are related to connector sockets X and WYZ and are only required when testing nacelle mounted accessories and are not relevant to the Overhaul Manual.

- (a) Set switch 127A to position 1 (OFF light goes out) and set switch 127B to position 1. The resistance meter should indicate SHORT.
- (b) Progressively turn switch 127B from position 1 to position 29 with a pause between positions. Meter readings should be more than 4 M ohms.
- (c) Readings of less than 4 M ohms are acceptable under the following conditions.
  - (i) Identify the two components by referring to Fig.512.
  - (ii) Locate the components in Tables 505 and 506 and add together the minimum insulation resistance values of the components.
  - (iii) If the interline insulation reading is equal to or exceeds the sum of the resistance values of the two components, the interline resistance value is acceptable.
- (d) Set switch 127B to OFF.
- (e) Set switch 128B to position 30 (light out) and then on to position 58. Observe the meter for readings below 4 M ohms (Ref.sub-para.(c)).
- (f) Set switch 128B to OFF (light on).
- (g) Set switch 129B to position 59 (light out) and then on to position 87. Observe the meter for readings below 4 M ohms (Ref.sub-para.(c)).
- (h) Set switch 129B to OFF (light on).
- (j) Set switch 131B to position 117 (light out) and then on to position 145. Observe the meter for readings below 4 M ohms (Ref.sub-para.(c)).

ENGINE DESPATCH

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (k) Set switch 131B to OFF (light on).
- (l) The line on switch 127A position 1 has now been tested for insulation against lines 2 to 145 on the B switches.
- (m) Set switch 127A to position 2 and set switch 127B to position 2. The resistance meter should indicate SHORT.
- (n) Progressively set B switches from position 3 to position 145 observing the meter and leaving switches in the OFF position when not in use.
- (p) Set switch 127A to position 3 and set switch 127B to position 3. The resistance meter should indicate SHORT.
- (q) Progressively set B switches from position 4 to position 145, observing the meter and leaving switches in the OFF position when not in use.
- (r) Repeat the foregoing operations until switch 131A reaches position 145.
- (s) On completion of tests, ensure that all interline switches (127-131) are in the OFF position (lights on).
- (t) Switch a.c. supply OFF.
- (u) Set switch 134 OFF.

D. Accessory Resistance Tests (Tables 503 and 504).

- (1) Connect the cables as follows:
  - (a) Engine harness cables to test set using jumper cables as required.
  - (b) Cable V from the test set to the thermocouple terminals on the engine.
  - (c) Cable J from the test set to the HP shut-off valve.

- (2) With the exception of 115V 400 Hz, which must be switched ON, set switches as detailed in Para.D.(2).
- (3) Carry out accessory insulation tests detailed in Tables 505 and 506.
- (4) The earth loop lamp must be ON when 50V, 100V and 200V insulation ranges are selected.
- (5) After completing the tests, return switches 134 and 136 to OFF.
- (6) Screens to earth tests (Table 507).
  - (a) Set switch 134 to 200V range.
  - (b) Operate switch 133 and check that the meter indicates open circuit. If a short circuit is indicated, identify the faulty screen as follows.
    - (i) Turn switch 132 from 1 to 22, pausing at each position to observe meter reading which should be above 2 M ohms.
    - (ii) Where a short circuit is indicated, identify the faulty screen by reference to the switch position in Table 507.
  - (c) Select switch 132 to position 23 and check that the meter indicates a short circuit.
  - (d) After completing the tests, return switch 132 to OFF (light on), and switch 134 to OFF.

F. Accessory Functional Tests.

- (1) Before carrying out the tests listed in Tables 508 to 511 connect the cables as detailed in Para.D.(1).
- (2) Set switches as detailed in Para.D.(2) with the exception of 115V. 400 Hz which must be switched ON.
- (3) Carry out accessory functional tests as detailed in Tables 508 to 511.

OVERHAUL

- (4) After completing the tests, return switches 140 and 142 to OFF.
- (5) Functional tests of igniters (Table 510).

WARNING: ENSURE THAT ALL PERSONNEL ARE CLEAR OF THE ENGINE. A MINIMUM OF 20 MINUTES MUST ELAPSE AFTER ANY MOTORING CYCLE, FUEL FUNCTIONAL TEST ETC., HAS TAKEN PLACE. THE ENGINE MUST BE THOROUGHLY DRAINED OF FUEL.

- (6) Return all switches to OFF, remove all cable looms and replace all plug protection caps and blanks removed for the test.
- (7) Jet pipe temperature thermocouple harness functional check.
  - (a) Check condition of batteries, then connect test set (Tool 2604) to the jet pipe temperature thermocouple test socket. If this is unavailable, use alternative test lead which incorporates crocodile clips to attach to each thermocouple circuit.
  - (b) Switch the test set ON and adjust datum control to give mid position on each of three meters.
  - (c) Place flexible spout of aerosol into hole in thermocouple and apply one squirt of CO<sup>2</sup> spray.
  - (d) The correct function of the thermocouple is indicated by a steady deflection of the three test set meters.
  - (e) Repeat the sequence for each thermocouple in turn.
  - (f) Switch the test set OFF and disconnect leads.

G. Check Bonding of Complete Engine.

- (1) Carry out the following bonding check using a double bridge milliohm meter.
- (2) Ensure that all bonding faces of bosses, clips, bolts and screw threads are free of any insulating materials e.g. paint and anodising.
- (3) Connect one lead of the Bondmeter to one of the primary bonding attachment points on the CCOC heat shields.
- (4) Starting with the foremost casing, place the other Bondmeter lead on each casing in turn and measure and record the bonding resistance. The resistance must not exceed 10 milliohms on each casing.
- (5) Starting from the top centre point of the foremost case and working in a clockwise direction (viewed from front), place the other Bondmeter lead on each accessory in turn, measure and record the bonding resistance. Repeat this procedure on each engine case in turn working rearwards. The resistance must not exceed 10 milliohms on each accessory.
- (6) Repeat para.(5) measuring and recording the bonding resistance of all tubes. As with the accessories, the resistance must not exceed 10 milliohms.
- (7) Repeat para.(5) measuring and recording the bonding resistance of all electrical wiring. As with the accessories the resistance must not exceed 10 milliohms.
- (8) Place the second Bondmeter lead on the second primary bonding attachment point, measure and record the bonding resistance. The resistance must not exceed 10 milliohms.

H. Check Harness.

- (1) Check the main electrical harness to ensure that the cable runs are free from fouls and are clipped correctly.
- (2) Ensure that all electrical connections connected to services and accessories are wire-locked correctly, where applicable.

J. Assemble Main Harness Stowage Bracket and Supports (Ref.Fig.514).

NOTE: The main harness stowage bracket and supports are under breakdown 71-51-01 and the IPC references in this para. are from 71-51-01 except where specifically detailed.

- (1) Assemble the dummy receptacles (11-100) to their locations on the mounting plate (11-110) and retain with screws (11-90), washers (11-80) and nuts (11-70).
- (2) Assemble the mounting plate assembly (11-110) to the jet pipe rear drain and the reheat purge air tubes brackets on the exhaust diffuser and spherical joint flange attachment.
- (3) Assemble the support (11-50) to the LP shaft signal system pulley shroud (76-21-01/2-430) on the exhaust diffuser.
- (4) Assemble the support (11-10) to the aircraft cross feed pipe bracket on the delivery casing and CCOC attachment flange.
- (5) Assemble the main harness loom connectors to their respective positions on the mounting plate. Tighten to secure.
- (6) Assemble the harness to the supports (11-50 and 11-10) and secure with integral straps.

- (7) Strap the harness to the centre and left support tubes on the CCOC with one support (11-40) at each tube position.
- (8) Strap the harness to the IDG drain tube with the support (11-30).

## 7. Final Despatch Procedures

### A. Install Heat Shield (Ref.Fig.515).

NOTE: The heat shield items are under breakdown 71-32-02 and the IPC references in this para. are from 71-32-02.

- (1) Apply lubricant 'B' to all attachment items.
- (2) Assemble the tie bracket (4-120) to the bracket on the exhaust diffuser and spherical joint flange attachment at the reheat purge tube flange position, secure with a nut (4-80) and bolt (4-90).
- (3) Retain the tie bracket (4-120) and bracket (4-130) to the bracket on the reheat purge tube adapter flange using the bolts (4-110) and nuts (4-100) securing the transmitter pitot manifold clipping.
- (4) Torque-tighten the nuts between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) Apply lubricant 'B' to the attachment bolts (4-30).
- (6) Apply lubricant 'G' to the mating surfaces of the heatshield (4-10) and washers (4-60).
- (7) Pass the reheat igniter cable through the aperture in the heatshield, assemble the shield to the six mountings and secure the shield to each mounting with a bolt (4-30), two dampers (4-50/70), two washers (4-60), a distance piece (4-40) and a nut (4-20) at each location.
- (8) Torque-tighten between 67 and 73 lbf in. (7,57 and 8,25 N.m).

D. Clean Engine.

- (1) Thoroughly clean the exterior of the engine with the approved solution i.e. kerosene or a soap and water solution.

E. Remove Engine from Rollover Stand and Assemble to Mobile Engine Stand or Trolley.

- (1) Remove engine from rollover stand (Ref.Fig.503).
  - (a) Position the engine in the 'Flight' position and lock the rollover rings with the retaining pins.
  - (b) Release and remove the eight bolts securing the top half of the rear rollover ring, then lift the top half clear of the engine.
  - (c) Attach the lifting equipment (Tool 2501) to the top lifting brackets of the engine at the intermediate case/HP compressor case flanges and at the delivery case/CCOC case flanges.
  - (d) Support the engine with the overhead hoist.
  - (e) Release the tension on the suspension spigots on the top half of the front rollover ring, ensuring that the engine is correctly balanced on the lifting equipment.
  - (f) Remove the pins securing the suspension spigots to the lower lifting points of the LP compressor casing/air intake flange.
  - (g) Release and remove the eight bolts securing the top half of the rear rollover ring, then lift the top half clear of the engine.
- (2) Raise the engine clear of the rollover stand.
- (3) Assemble the top halves of the rollover rings to the rollover stand.

OVERHAUL

- (4) Assemble the engine to the mobile engine stand (Tool 1265) as detailed in 2.B.(6), (7) and (8), or to trolley (Tool 1266) as follows:
- (a) Remove the rollover trunnion bushes from the engine trunnions and assemble to the rollover stand.
  - (b) Remove the trunnion adapters (Tool 1177 and 1193) from the trolley or mobile engine stand and assemble to the engine trunnions and secure with retaining pins.
  - (c) Lower the engine into the trolley (Tool 1266) until the trunnion adapters locate in the trunnion locations. Secure the right and left-hand engine front leg supports to the LP compressor case front flange.
  - (d) Secure the trunnion adapters with the pedestal clamps.
  - (e) Remove lifting equipment.

F. Carry Out C. of G. Check and Weigh Engine (Ref.Fig.517 and 518).

- (1) Attach the steelyard balance to the overhead hoist and adjust the balance weights until the balance pointers of the steelyard are in line.

NOTE: Prior to the next operation, weigh the C. of G. sling (Tool 1276) and mark the weight at some convenient position on the sling.

- (2) Attach the C. of G. sling (Tool 1276) to the steelyard then attach the C. of G. sling to the top lifting points on the engine at the intermediate case/HP compressor case flange and at the delivery case/CCOC case flanges.

- (3) Release and remove the trunnion pedestal clamps from the trunnion adapters.
- (4) Raise the engine clear of the trolley or stillage and remove the trunnion adapters from the engine trunnions.
- (5) Remove the transportation blanks from the Air Inlet and Exhaust Diffuser.
- (6) Position a spirit level at the location provided on the C. of G. sling, adjust the sling handwheel until the engine is level as indicated by the spirit level.
- (7) Note the indicated reading shown on the scale of the C. of G. sling.

NOTE: The indicated reading shown on the sling scale is not the C. of G. of the engine.

- (8) Use the correction chart (Ref.Fig.518) to determine the C. of G. of the engine, record the C. of G. in the engine records.

NOTE: The mean C. of G. of the engine from the correction chart will be 12.3 in. (302,42 mm)  $\pm$  0.25 in. (6,35 mm) forward of the engine trunnions.

- (9) Weigh the engine.

NOTE: The weight of the engine is determined in the engine state existing after finalising these despatch procedures, e.g. the engine will be weighed without the IDG, the Main and Standby Hydraulic Pumps and the Air Starter.

INSTALLATION OF ENGINE IN MOISTURE AND VAPOUR PROOF BAG AND  
TRANSPORTATION STAND

1. General

On completion of overhaul, testing and engine despatch procedures the engine is installed in a moisture and vapour proof (MVP) bag for protection of the engine during storage and transportation.

NOTE: For engines being despatched by cargo aircraft, ensure that the engine is assembled to the light weight stand (Tool 3167) which is specifically designed for use in cargo aircraft.

NOTE: For engines being despatched or stored locally ensure the engine is assembled to the mobile storage stand (Tool 1780 or 3166).

2. Install the Engine in the MVP Bag (Tool 3168)

A. Prepare the Transportation Stand (Ref.Fig.901).

- (1) Remove the left and right-hand trunnion blocks and the left and right-hand engine front supports from the transportation stand.
- (2) Carefully unpack the MVP bag from the container, unfold and inspect for damage.  
  

CAUTION: CARE MUST BE TAKEN WHEN HANDLING MPV BAG IN CLOSE PROXIMITY OF ENGINE OR STAND TO AVOID DAMAGE TO MVP MATERIAL.
- (3) Carefully spread the MVP bag over the transportation stand. Align the four holes of each trunnion block location of the MVP bag with the trunnion block locations of the stand.
- (4) Assemble the right and left-hand trunnion blocks to the MVP bag and stand then secure each with four nuts and bolts.
- (5) Align the engine front mounting locations of the MVP bag with the engine front mounting locations of the stand, assemble the right and left-hand engine front mountings to the MVP bag and stand, and secure each with four nuts and bolts.

B. Prepare the Engine and Install in the MVP Bag/Stand (Ref.Fig.902).

- (1) Assemble the lifting equipment (Tool 2501) to the lifting brackets on the engine at the intermediate case/HP compressor case flanges and at the delivery case/combustion chamber outer case (CC0C) flanges.
- (2) Support the engine, and release and remove the pedestal clamps from the trunnion brackets on the trolley.
- (3) Release the engine front supports from the LP compressor case and raise the engine clear of the trolley.
- (4) With the engine suspended at a suitable working position and using a suitable protective padding material, cover all sharp protrusions on the engine to prevent any chafing on the MVP bag.
- (5) Remove the trunnion caps and adapters from the trunnion blocks, then assemble the trunnion adapters to the engine trunnions.
- (6) Position the engine over the stand and MVP bag and lower the engine carefully until the trunnion adapters are just in position.
- (7) Attach the stand front support arms to the engine mounting ring with the quick release pin on the right-hand side and a pin and locking clip on the left-hand side, release the tension from the overhead hoist and remove lifting equipment.
- (8) Assemble the trunnion caps onto the trunnion blocks and secure with four bolts. Wire-lock the bolts.

C. Seal the Engine in the MVP Bag (Ref.Fig.903).

- (1) Place 45 lbs (20.4 Kgs) of fresh silica gel into clean dry bandoliers and place over the engine with grease proof paper interposed between the bandoliers and the engine.
- (2) Locate a humidity indicator in the MVP bag window, then assemble the MVP bag support straps to remove any possibility of strain on the seal.

- (3) Using the sealing tool provided with the MVP bag, seal the bag ensuring that the inner and outer sealing sections are fully engaged over the total length of the sealing section. Engage press stud tabs and support straps as soon as is practicable to remove strain from sealing section.
- (4) Examine the exterior of the MVP bag for damage and carry out any repairs necessary using the repair kit provided with the MVP bag.
- (5) Examine the humidity indicator after 24 hours. If the humidity indicator has turned pink then the bag must be resealed. Open the bag, discard the silica gel and recharge the dry bandoliers with 45 lbs (20.4 Kgs) of fresh silica gel and reseal the engine as detailed in para.(1), (2) and (3). If the humidity indicator remains blue after the 24 hours time delay from sealing, complete the engine records.

PREPARE ENGINE FOR DESPATCH - SPECIAL TOOLS,  
FIXTURES AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Table 1001 are those required to prepare the engine for despatch.
- B. The tools have been listed in order of usage, and the Tool Ref.No. is the number quoted in the text.
- C. The tools have been illustrated in order of usage, but tools used in more than one aspect of overhaul will only be illustrated once. Additional illustrations of tooling in operation (as thought necessary), are included in the text in the appropriate section.

2. Engine Despatch Tools

## STANDARD PRACTICES - DISASSEMBLY

### 1. General

- A. Disassembly comprises of removing the electrical harness, tubes and components from the engine and then dismantling each assembly, if applicable, to a sufficient depth to facilitate subsequent overhaul procedures.
- B. During the disassembly procedures it is assumed that all normal locking devices will be released prior to removing bolts, nuts, etc.
- C. When disconnecting tubes having union nut type end fittings, the adapter and/or tube shall be prevented from turning with the union nut by using the appropriate wrenches.
- D. Approved blanks and covers shall be installed on the electrical plugs, tubes and components at the appropriate stages of disassembly to protect joint faces, and also to prevent the ingress of foreign matter.
- E. An initial examination of components shall be carried out as they are removed, and any evidence of defects which may be removed by cleaning shall be noted on the inspection report. These components shall then be passed to inspection for assessment of defects prior to cleaning.
- F. All self-locking nuts, captive nuts and inserts are reusable providing that they satisfy the Inspection/Check examination (Ref.72-09-00) and the locking (run-down) torque requirements specified in the relevant Sub-assembly Chapter.
- G. Appropriate measures shall be taken to collect spillage of oil, fuel, etc. as tubes and components are disconnected and/or removed.
- H. Where special containers and pallets are specified, they must be used to segregate and protect components after disassembly. Where special containers are not specified, use other suitable containers to fulfil the same purpose.

### 2. Locking Devices

- A. Split Cotter Pins and Lockwire Removal.
  - (1) Split cotter pins must be removed and locking wire must be cut and removed prior to releasing nuts, etc.

DISASSEMBLY

71-09-00

Page 101

Nov 1/78

OLYMPUS 593

MK.610-14-28  
OVERHAUL

(2) Split cotter pins and locking wire shall be scrapped.

B. Clipnut Assemblies Removal.

(1) Insert the tapered thin edge of a suitable lever between the mating component and the spigot side of the clip.

(2) Turn the lever to lift the spigot from its socket and withdraw the spigot.

3. Quick Attach/Detach (QAD) Couplings (Ref.Fig.101)

- A. Support the assembly to be removed with the specified lifting equipment.
- B. Unscrew and remove the coupling ring clamping bolt and spherical washer.
- C. Use the specified drift against the flat face of the release anvil and drive the coupling ring in the direction to separate the trunnions until it is just loosened.
- D. Turn the coupling ring by hand until the threads disengage and align with their withdrawal slots.
- E. Withdraw the assembly.
- F. Install the appropriate blanks.

STANDARD PRACTICES - ASSEMBLY1. General

- A. Before commencing assembly, check the inspection records/ reports to ensure that all components are cleared for assembly, having had any repairs or modifications called for embodied.
- B. Prior to assembly, examine all components to ensure that they have not been damaged during storage or transit, and that they are clean.
- C. When installing or connecting items or units during the assembly sequence, ensure that joint faces and sealing ring grooves are clean and free from damage.
- D. During assembly, all blanks and covers shall be left in position until the assembly sequence necessitates their removal, in order to protect protruding items and joint faces and to prevent the ingress of foreign matter. The appropriate engine blanks and covers shall be installed at the completion of engine final assembly.
- E. Throughout the assembly, reference is made to the Modification (Mod) No. or Service Bulletin (S.B.) No. to accommodate engines of varying standards brought about by the introduction of modifications. Where direct replacement occurs unaffected the assembly sequence, the S.B. or Mod. will not be quoted, but the Illustrated Parts Catalogue (I.P.C.) reference will denote the S.B. or Mod., enabling the engine to be built to the standard required. For information on the relationship of Mod. and S.B., refer to the Service Bulletin Index, and for embodiment information (if applicable), refer to the Service Bulletin folder.
- F. During assembly, all vital dimensions that must be obtained are referenced in the text to the appropriate section and Ref.No. of the Fits and Clearances Schedule (F.C.S.).
- G. All self-locking nuts, captive nuts and inserts that have passed the Inspection/Check examination are reusable providing that they satisfy the locking (run-down) torque specified in para.3.
- H. Nuts and bolts supplied with corrosion preventative coatings must be thoroughly cleaned to remove all traces of preservatives. Ensure that all surfaces are clean and dry before the application of the prescribed lubricant.

## 2. Use of Lubricants, Sealing and Jointing Compounds and Consumable Materials

### A. General.

**CAUTION:** EXTREME CARE MUST BE TAKEN TO ENSURE THAT MOLYBDENUM DISULPHIDE LUBRICANT IS NOT USED IN AREAS WHERE IT IS NOT SPECIFIED. MOLYBDENUM DISULPHIDE LUBRICANTS BREAK DOWN ABOVE 300 DEG. C RELEASING SULPHUR WHICH CAN INDUCE STRESS CORROSION AND PREMATURE FAILURE OF ENGINE PARTS SO LUBRICATED.

- (1) Where the application of a lubricant or sealing compound is necessary during assembly, it is specified by means of a letter, e.g. apply lubricant 'B'. Refer to Table 501 for specifications and approved brands for these materials.
- (2) Where the use of a consumable material is required during assembly, it is specified by the material nomenclature e.g., use silicone varnish. Where there is more than one material with the same nomenclature, they will be differentiated by a letter e.g., use lacing braid A. Refer to Table 501 for specifications and approved brands for these materials.

### B. Thread Lubricants.

- (1) Apply the recommended lubricant (Ref. appropriate Sub-assembly Chapter) immediately prior to assembly.
  - (a) Ensure that all traces of preservatives are removed and that the surfaces to be lubricated are clean and dry.
  - (b) Using a suitable small brush (if the viscosity of the lubricant permits), apply just sufficient lubricant to cover the following surfaces:

Nut to bolt or stud	...	Abutment face of nut and threads of bolt or stud
Setbolt	... ..	Abutment face of bolthead and threads of bolt
Retaining nut to shaft	...	Abutment face of nut and threads of shaft

Tube end ...      ...      Union body threads and  
fittings                              ferrule groove or abutment  
   face mating with thrust wire  
   or nut respectively

- (2) Ensure that lubricant contamination on any other surface is removed immediately.

#### C. Jointing Compounds.

- (1) Ensure that the joint faces are smooth and free from burrs.
- (2) Clean the joint faces using a clean, lint free cloth moistened with a group 2 or 4 solvent (Refer to Table 501).
- (3) Apply a thin, even coating of jointing compound to both faces using a clean stiff bristle brush or a small flexible knife; leave a clear border (0.050 in. (1,27 mm) maximum width) around the inner edges of the joint thus preventing internal exuding.

NOTE: Sufficient compound should be applied to allow a slight exuding from the outer edges of the joint when it has been made.

- (4) A minimum of 10 minutes air drying time must be allowed before the joint is assembled.

ASSEMBLY

71-09-00

Page 504b

Dec 31/00

OLYMPUS 593

MK.610-14-28

SNECMA

OVERHAUL

- (5) Check the torque loading of joint securing nuts or bolts after a wait of at least 10 minutes after torque-tightening and, if necessary, restore to required value. Compound can slowly exude under pressure resulting in a considerable reduction of nut or bolt torque loading.
- (6) Remove surplus compound using a clean, lint free cloth moistened with a group 2 or 5 solvent (Refer to Table 501) before complete hardening occurs.

### 3. Torque-tightening

#### A. General.

- CAUTIONS:
1. EXTREME CARE MUST BE TAKEN TO ENSURE THAT MOLYBDENUM DISULPHIDE LUBRICANT IS NOT USED IN AREAS WHERE IT IS NOT SPECIFIED. MOLYBDENUM DISULPHIDE LUBRICANTS BREAK DOWN ABOVE 300 DEG C. RELEASING SULPHUR WHICH CAN INDUCE STRESS CORROSION AND PREMATURE FAILURE OF ENGINE PARTS SO LUBRICATED.
  2. IT IS OF THE UTMOST IMPORTANCE TO ENSURE THAT ALL FEED/SCAVENGE FILTERS AND MAGNETIC PLUG ASSEMBLIES ARE FULLY TORQUE-TIGHTENED ON ASSEMBLY. FAILURE TO DO THIS CAN RESULT IN OIL LEAKAGE IN FLIGHT WHICH MAY NOT BE APPARENT DURING GROUND CHECKS/RUNNING.
  3. WRENCHES USED FOR TORQUE-TIGHTENING MUST BE CALIBRATED AT REGULAR INTERVALS AGAINST A CERTIFIED CHECKING RIG. TORQUE WRENCH ACCURACY SHALL BE WITHIN  $\pm 5$  PER CENT.
- 
- (1) A specific torque loading is applied when tightening threaded components to ensure optimum security and to prevent overstressing which could result in subsequent failure.
  - (2) The torque loadings are specified in the relevant Sub-assembly Chapters, together with the applicable locking (run-down) torques where the component concerned has a friction type locking device.

ASSEMBLY

71-09-00

Page 505

Jun 1/99

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

- (3) Never exceed the stated maximum torque loading nor loosen an item when torque-tightened to obtain alignment of a locking device.
- (4) To ensure that the specified torque loading is achieved, the components must be lubricated as specified in para.2.A. and B.

**B. Using Adaptors With Torque Wrenches.**

NOTE: In certain instances a special adapter is specified to enable a torque wrench/adapter assembly to be calibrated on the checking rig, rendering the following calculations unnecessary.

- (1) When an adapter which alters the leverage is used with a torque wrench it is necessary to compensate the indicated torque reading accordingly.
- (2) If the adapter increases the effective leverage (Ref.Fig.501, detail A), the following formula must be used to determine the compensated wrench setting:

$$S = \frac{L \times T}{L + E}$$

where S = compensated wrench setting  
L = effective length of wrench  
E = effective length of adapter  
and T = required torque loading

NOTE: When using this and similar formulae, all quantities must be expressed in similar units, i.e. wrench length in feet if required, torque is in lbf ft.

ASSEMBLY

71-09-00

Page 506  
Dec 31/99

**OLYMPUS 593**MK.610-14-28  
OVERHAUL

sneema

- (3) For example, to find the compensated wrench settings when using a 10 in. wrench and 5 in. adapter to torque-tighten a nut to between 67 and 73 lbf in.:

$$S = \frac{10 \times 67}{10 + 5} = 44.7 \text{ lbf in. (lower limit)}$$

and

$$S = \frac{10 \times 73}{10 + 5} = 48.7 \text{ lbf in. (upper limit)}$$

therefore the wrench settings are 45 and 49 lbf in. (corrected to the nearest lbf in.).

- (4) If the adapter decreases the effective leverage of the wrench (Ref. detail B) the formula must be altered to subtract the adapter length from the wrench length:

$$S = \frac{L \times T}{L - E}$$

OVERHAUL

- (5) No compensation of the wrench setting is required if the adapter does not alter the effective leverage of the wrench (Ref. detail C).
- (6) When the adapter axis is not parallel to the wrench axis, the effective length of the adapter must be measured in a plane parallel to the wrench axis (Ref. detail D).

C. Components with Locking Features Requiring Alignment.

- (1) Lubricate the assembly as specified in the relevant Chapter.
- (2) Run down the nut or bolt by hand.
- (3) Torque-tighten the nut or bolt to the lower figure specified.

CAUTION: NEVER SLACKEN OFF TORQUE-TIGHTENED NUT OR BOLT TO ACHIEVE ALIGNMENT OF LOCKING FEATURE.

- (4) Continue tightening slowly within the upper torque limit until alignment of the locking feature is achieved.

4. Components with Friction Type Locking Features

A. Locking (Run-down) Torque Check.

- (1) Lubricate the item as specified in para.2.B.
- (2) If initially the item only requires hand tightening, the locking portion of the item need not be engaged. If nip tightening is called for, the item is to be tightened with a spanner below the torque figure, but sufficient to ensure the item and any item it secures, cannot be loosened by persons working on the engine, or movement of the engine.
- (3) When tightening of the item is required, run down the nut or bolt until the locking element is fully engaged, with the load faces out of contact.

NOTE: A self-locking nut is fully engaged when the end of the bolt is flush with, or slightly protruding from the end of the nut.

MK.610-14-28  
OVERHAUL

- (4) Using a direct reading torque wrench, measure the torque required to turn the nut or bolt. This locking (run-down) torque must be within the limits specified in the relevant Sub-assembly Chapter, or if not quoted, as specified in Table 502.
- (5) If the nut or bolt fails to meet the locking torque requirements, use selective assembly or, if this fails, renew the nut or bolt and recheck the locking torque until satisfactory.
- (6) Torque-tighten the nut or bolt to the figure specified in the relevant Sub-assembly Chapter.

**NOTE:** Unless otherwise stated, the torque-tightening figure is inclusive of the locking torque, i.e. the locking torque shall not be added to the torque-tightening figure.

- (7) After torque-tightening the nut ensure that a minimum of 2.5 threads is protruding beyond the outer face of the nut.
- (8) Reject and destroy any nut where it is obvious that it will not give a satisfactory locking torque on any bolt. Do not attempt to restore locking properties.

## 5. General Locking Procedures

### A. Wire-locking (Ref.Fig.502).

- (1) Unless otherwise stated, use 0,8 mm (0.031 in.) diameter Nimonic steel locking wire for all wire-locking applications.
- (2) Ensure that the locking wire is adequately tensioned to resist rotation of the locked component. Also ensure that there are no untwisted lengths of wire in excess of 0.375 in. (9,525 mm) and no unsupported lengths in excess of 3 in. (76,2 mm).
- (3) Refer to the illustration for typical acceptable locking configurations.
- (4) Ensure that cut off pieces of wire are retrieved and are not allowed to become lost in or around the engine.
- (5) Tuck the free end of the locking wire away so that it cannot catch either skin or clothing.

### B. Method of Wire-locking Electrical Plugs (Ref.Fig.503).

- (1) Thread wire through the locking hole and middle it. Detail A.
- (2) Make one complete twist (one half pitch) to start, ensuring a snug fit around the lug without straining the wire.
- (3) Use wire-locking pliers to keep the wire taut whilst twisting in tension. Refer to Table 503 for the pitch ratio. Detail B.

WIRE GAUGE	PITCHES EACH
	1.000 IN. (24,2 MM)
20 SWG, 0.036 in. (0,889 mm)	2½ to 5
0,8 mm (0.031 in.)	3 to 6
22 SWG, 0.028 in. (0,71 mm)	3 to 6
26 SWG, 0.018 in. (0,46 mm)	5 to 6½

Wire-locking Pitch Ratio

OVERHAUL

- (4) Take the wire to the second lock hole in a direction such that any tendency for a part to loosen will be counteracted by the wire.
- (5) Pass the wire through the final lock hole and ensure that there is tension between the holes. Form a tail approximately 0.75 in. (20 mm) in length. Detail C.
- (6) Cut the surplus wire from the tail and double back the exposed ends to prevent a hazard.
- (7) The maximum number of parts in series that can be locked together using the double twist wire method is three. Detail D.
- (8) There must be no untwisted lengths in excess of 0.197 in. (5,0 mm), and the developed length between lock holes must not exceed 3.000 in. (75,0 mm).

## 6. Electrical Harness

### A. Method of Lacing Looms (Ref.Fig.504).

- (1) Pass lacing braid through the middle of the cable bunch and make a clove hitch. Detail A.
- (2) Make a further half hitch. Detail B.
- (3) Pull both ends of the lacing braid firmly and secure with a reef-knot. Detail C.
- (4) Cut ends off leaving tails with a minimum length of 0.250 in. (6,35 mm) and cement the finished ends with silicone varnish.
- (5) Repeat lacing of the cables at regular intervals. Refer to Table 505 for the maximum distance allowed between ties.

0.625 in. and above (15,875 mm and above)	4.000 in. (101,600 mm)

Distance Between Cable Lacings  
Table 505

B. Method of Lacing Junctions (Ref.Fig.504).

- (1) At junctions, select the largest bunch of cables, pass lacing braid through the middle of the bunch and make a clove hitch. Detail A.
- (2) Make a further half hitch. Detail B.
- (3) Pull both ends of braid lacing tight and securely reef-knot. Detail C.
- (4) Ensure that there is sufficient lacing at end 'Y' to tie a further reef-knot on completion of junction lacing. Detail D.
- (5) Thread end 'Z' of braid lacing between the smaller and larger bunches of cables. Detail D.
- (6) Take the braid lacing a turn around the small bunch of cables and again pass it between the two bunches. Detail D.
- (7) Take the braid lacing around the larger bunch of cables and pull tight, completing a figure-of-eight whip. Detail D.
- (8) Repeat the figure-of-eight sequence six times, pulling the braid lacing tight after each sequence.
- (9) Take braid lacing across the six completed whippings to the start point and thread it between the two bunches of cables. Detail E.

OVERHAUL

- (10) Return the braid lacing across the six completed whippings on the opposite side and thread it between the two bunches of cable. Pull tight to form a frapping lashing. Detail E.
- (11) Repeat this sequence until two more frapping lashings are obtained.
- (12) Take the braid lacing across the whipping to the start point. Pull tightly and pick up end 'Y' of the braid lacing. Tie a firm reef-knot together with end 'Z', cut off the excess lacing leaving tails with a minimum length of 0.250 in. (6,350 mm) from the knot. Detail F.
- (13) Cement the knot using silicone varnish.

C. Cable Twisting and Plaiting (Ref.Fig.505).

NOTE: The length and position over which the twisting or plaiting is required is shown on the appropriate loom template.

- (1) Branches of two single cables are to be twisted together into the pattern shown, no lacing is required.
- (2) Branches of three single cables are to be plaited together to form the pattern shown, no lacing is required.

D. Clamp Marking Using Coloured Lacing Braid (Ref.Fig.506).

- (1) Divide the bunch of cables into approximately two equal bunches, middle the lacing braid and pass the ends around one bunch of the divided cables.
- (2) Tie a firm reef-knot facing away from the cables.
- (3) Pass each end of the lacing braid around each side of the complete bunch of cables and tie a half-knot, pulling tight, opposite to the reef-knot position.
- (4) Again pass each end of the lacing braid around each side of the complete bunch of cables and tie a half-knot opposite to the previous half-knot position.

- (5) Once more pass each end of the lacing braid around each side of the complete bunch of cables and tie a reef-knot, pulling tight, opposite to the previous reef-knot position. A West Country whip has now been accomplished.
- (6) Cut off the free ends leaving tails of approximately 0.250 in. (6,350 mm) long.
- (7) Cement the reef-knot with silicone varnish.
- (8) Repeat the whole procedure for West Country whipping at a point 0.750 in. (19,050 mm) from the first whipping ensuring that the centre line for the clamp finishes midway between the two whippings.

E. Unique Point Clamp Marking Using Coloured Lacing Braid (Ref.Fig.506).

- (1) Perform procedure for clamp marking (Ref. para.6.D.) except that the distance between whippings is 1.250 in. (31,750 mm).

F. Securing Tape Markers to Harness Assemblies (Ref.Fig.507).

- (1) Attach the AGS clip to the tape marker with the ears of the clip on the same side as the marked side of the tape. Detail A.
- (2) Pass the tape through the centre and then around the bunch of cables. Pull tight and secure by flattening the two ears of the AGS clip. Detail B.
- (3) Fold the tape back and secure by flattening the two ears of the AGS clip. Detail C.
- (4) Fold the tape forward and trim sufficiently to tuck under the first fold, then tuck it in.
- (5) Apply pressure at the ears of the AGS clip to ensure a snug fit. Detail D.

G. West Country Whipping (Ref.Fig.508).

- (1) Middle the braid, pass the ends around the split ferrule to be whipped and tie a reef-knot.

OLYMPUS 593 ENGINE OVERHAUL MANUAL

TEMPORARY REVISION NO. 71-504

Insert in Chapter 71-09-00 page 518

This TR replaces TR71-503 which should be REMOVED AND DESTROYED

REASON FOR ISSUE:

Revised method of tightening electrical connectors on the engine with special attention to eight specified connectors - (EA 73 and CM42083).

Re-issued. Coupling nut tightening procedure amended  
(CM42083 issue B).  
Editorial

STANDARD PRACTICES - ASSEMBLY

6. Electrical Harness

Additional Topic

H. Olympus 593 - Electrical Connectors

- (1) To combat the problem of electrical connectors loosening due to vibration a new method of tightening the connectors is to be used. This method is to be applied to all connectors on the engine.
- (2) Mod CM42083 calls up special attention the eight connectors listed below:-

D9 - No. 4 bearing failure warning oil outlet thermometer  
G6 - Engine Oil inlet thermometer  
C5 - Anti-icing pressure switch  
H1 - Hydraulic Pump off load valve (main)  
E5 - Anti-icing control valve solenoid  
E11 - Fuel heater air valve solenoid  
B3 - Front vibration unit  
D6 - Engine LP governor speed probe

The modification calls for initial tightening as specified in 'C' and for a yellow line to be painted across the coupled connectors so that they may be easily inspected for loosening in service. Wire locking will not be replaced.

- (3) Procedure for tightening the electrical connectors:-
  - (a) Align keyways and push connectors together.
  - (b) Tighten coupling nut using fingers only until resistance is felt.
  - (c) Push plug from cable clamp using a wagglng action until resistance is felt.

14 July 1977

TR71-504  
71-09-00  
TR Page 1 of 2

OLYMPUS 593 ENGINE OVERHAUL MANUAL

- (d) Tighten coupling nut as in (b)
- (e) Repeat steps (b) and (c) until the connector cannot be waggled any more and the coupling feels firm.
- (f) Check the coupling nut is finger tight.
- (g) Using suitable tooling tighten coupling nut a further 1/8 of an inch.

CAUTION: DO NOT OVER TIGHTEN OR DAMAGE WILL OCCUR.

- (h) Paint a yellow line across the coupled connector.
- (4) Inspection
- (a) On connectors modified with the yellow line inspect to ensure alignment still exists. If not this must be recorded on the worksheets giving an indication of total misalignment and Electrical Systems Development informed.
  - (b) On connectors where the modification has not been carried out, at the inspection period the coupling nut must be loosened by three complete turns and the connector retightened using the procedure in '(3)'.
- (5) The yellow line must be maintained in a serviceable condition and repainted if the component or connector is changed.

SNECMA

- (2) Continue half-knotting on alternative sides to the end of the split.
- (3) Securely reef-knot the ends of the braid and cut off the ends leaving free ends 0.315 in. (8,0 mm) in length.

NOTE: All the knots are to be on the cable.

- (4) Cement the finished ends with silicone varnish and cure the completed assembly for 8 hours at 80 deg C.

#### H. Loom Clearances.

CAUTION: FAILURE TO INSTALL THE ELECTRICAL HARNESS CORRECTLY WILL LEAD TO DAMAGE WHICH CAN RESULT IN SERIOUS AIRWORTHINESS PROBLEMS.

- (1) Check the main electrical harness to ensure that the cable runs have adequate clearance and are clipped correctly as specified in the relevant procedure for the affected component.
- (2) Ensure that all electrical connections are correctly wire-locked, where applicable.

### 7. Tubes

#### A. Rigid and Flexible Tubes.

- (1) Examine each tube prior to assembly to ensure that the tube is clean, free from damage and two serviceable wire-locking holes are available in each union nut.
- (2) Lubricate and install new sealing rings (if applicable) and sparingly lubricate the tube union nuts as specified in the relevant text.
- (3) Remove the blanks, then position the tube and ensure that the end fittings align with their locations. Connect the end fittings and tighten as far as possible by hand ensuring that there is no stiction of the union nut. Ensure that the tube is not kinked, twisted, distorted or stretched when the union nuts are tightened.
- (4) Ensure that the tube support clips will align without straining the tube.

ASSEMBLY

71-09-00

Page 522

OLYMPUS 593

MK.610-14-28

SNECMA

OVERHAUL

**CAUTION:** DO NOT STRAIN RIGID TUBE TO ALIGN END FITTINGS AND/OR SUPPORT CLIPS. IF TUBE WILL NOT ALIGN WITHOUT STRAIN, REMOVE IT AND INVESTIGATE CAUSE.

- (5) Using a suitable spanner to prevent turning of the tube and/or union adapter (if applicable), torque-tighten each union nut in turn to the figure specified in the relevant text. Flexible tubes with wire type union nut must be torque-tightened three times to ensure correct seating. The union nut must be torque-tightened and slackened twice prior to the final torque-tightening.
- (6) Wire-lock the union nuts.
- (7) Install the tube support clips ensuring that the correct bushes, packing or tape is used between the clamp and the tube. Do not overtighten clamps on flexible tubes and cause nicking.
- (8) Ensure that all tubes have a clearance between each other and other components of not less than 0.200 in. (5,08 mm) with the exception of those listed in 71-00-01 Assembly.

**CAUTION:** DO NOT ATTEMPT TO RECTIFY LEAKAGE FROM TUBE END FITTINGS BY FURTHER TIGHTENING. REMOVE TUBE, INSTALL NEW SEALING DEVICES AND/OR RECTIFY DEFECT, THEN RE-INSTALL TUBE AND RECHECK FOR LEAKAGE.

## 8. Blanking

### A. Engine Final Assembly.

- (1) Remove blanks from components and tubes immediately prior to the assembly of, or to, the component or tube. Ensure that only those blanks necessary for the assembly of the item are removed, and that all other mounting faces, tube ends etc. have blanks assembled.
- (2) Ensure that all tubes which connect to aircraft services, i.e. fuel, air and hydraulic, must be blanked with the correct transit blanks.
- (3) Ensure that the correct transit blanks are assembled to the air intake case and turbine exhaust diffuser.

ASSEMBLY

9. Quick Attach/Detach (QAD) Couplings (Ref.Fig.509)

A. Engage, Tighten and Lock QAD Couplings.

- (1) Prepare coupling for tightening before unit installation.

**CAUTION:** EXAMINE THE THREAD SURFACES AND ABUTMENT FACES OF THE RING AND FLANGE FACES TO ENSURE ALL SURFACES ARE FREE OF ANY DEFECTS OR DAMAGE MARKS.

- (a) Clean the surfaces of the coupling ring and flange thread segments, and the abutment faces of the spherical washer and bolt, using a clean, lint free cloth moistened with a group 1 or 3 solvent (Refer to Table 501).
- (b) Apply a thin coating of lubricant 'A' to the thread surfaces, bolt threads and abutment face, and the spherical washer abutment faces.
- (c) Apply lubricant (70-00-03, Sealing Devices) to the toroidal sealing ring before installation.

B. Engage Coupling Ring.

- (1) Align the unit to the mounting face and turn the coupling ring so that its thread segments align with the treaded flange slots and the spherical nut trunnion is positioned so that it can be tightened to the clamping bolt trunnion when the segmented threads are engaged.
- (2) Locate the unit on the mounting face as detailed in the relevant chapter. Ensure that the sealing ring is in position, assemble pins and drive shaft splines are engaged and that the mating faces are squarely in abutment.
- (3) Turn the coupling ring in the direction to bring the trunnion together by hand and engage the segmented threads as far as possible.

C. Tighten the Coupling Ring.

**CAUTION:** ENSURE THAT THREADS HAVE CORRECTLY ENGAGED BEFORE ATTEMPTING TO TIGHTEN COUPLING RING.

- (1) Insert clamping bolt, together with spherical washer, through fixed locking trunnion and screw into spherical nut of coupling ring trunnion by hand.

- (2) Measure the locking (run-down) torque of the bolt.
  - (a) Screw bolt in until load faces are just out of contact.
  - (b) Measure torque necessary to turn bolt and ensure that it is within the specified limits given in the relevant component chapter. Inspect mating surfaces of the ring and flange to ensure freedom from surface defects.
- (3) Tighten the locking bolt with a wrench (Ref.72-00-00, special tools Tool 419) using one hand only.

NOTE: The amount of turn given to the bolt by use of this wrench gives an action that results in a positive full run-down to near the final tightening position without exceeding the torque-loading limit.
- (4) Torque-tighten the locking bolt to the value specified for the unit.
- (5) Tap radially around the periphery of a coupling ring, where accessible, using a hide faced hammer or an 8 ounce hammer and aluminium drift and ensure equal disposition of the ring.
- (6) Measure the torque-loading remaining on the locking bolt.
- (7) Repeat operations (4), (5) and (6) until the following conditions are met.
  - (a) There is less than 18 lbf in. (2 N.m) difference between the specified torque-loading (4) and the torque-loading remaining (6).
  - (b) The bolt is tightened to within the specified torque-loading limits.

## ENGINE MOUNTINGS - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

71-20-00

Page 201

Dec 1/76

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

ENGINE MOUNTINGS - INSPECTION/CHECK

Printed in England

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards. Special attention must be paid to the critical areas of certain specified items during inspection. An instruction to this effect is included in the inspection detailed for the specified item.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

#### A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

Items marked with an asterisk (\*) in Table 301 feature defined critical areas. (Ref.Fig.303). In addition to the general overall crack detection examination, special attention must also be paid to these defined critical areas during the inspection.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

## OLYMPUS 593 ENGINE OVERHAUL MANUAL

TEMPORARY REVISION No.71-505

Insert in chapter 71-20-00 facing page 305

### REASON FOR ISSUE:

To define a method of measurement of wear in spherical bores on mounting brackets B.401953 and B.401952 and to give an acceptance standard for wear.

Rolls-Royce OLY/SEDP/569 refers.

### ENGINE MOUNTINGS - INSPECTION/CHECK.

#### 5. Mounting Brackets (302-20/30).

Amend sub-para A (2) to read:-

##### (2) Wear.

With a NEW spherical fitted in the housing bore, measure both the diametral and the axial movement possible.

Accept wear in a diametral direction up to 0.018" and in an axial direction up to 0.030".

OLYMPUS 593

MK.610-14-28  
OVERHAUL

sneema

Printed in England

(2) Wear.

(a) Light witness mark. Accept.

(3) Scores.

(a) Not more than 0.005 in.  
(0,130 mm) in depth. Accept after repair.

B. Inspect Attachment Flange.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Not more than 2 per cent  
reduction in flange  
thickness. Accept.

(b) Any elongation of bolt-  
holes. Reject.

(3) Scores.

(a) Not more than 0.005 in.  
(0,130 mm) in depth. Accept after  
repair providing  
repair does not  
reduce flange  
thickness by more  
than 2 per cent

(4) Distortion.

(a) Any distortion. Accept if com-  
patibility is  
preserved.

6. Mounting Trunnion (302-60)

A. Inspect Attachment Flanges.

**CAUTION:** THE FRONT AND REAR FLANGE FILLET RADII ARE A  
DEFINED CRITICAL AREA. (Ref.Fig.303). SPECIAL  
ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF  
DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Nicks and burrs. Accept after  
repair.

(2) Wear.

(a) Any elongation of bolt-holes or headless pin-hole. Reject.

(3) Isolated scores/scratches.

(a) Not more than 0.005 in. (0,127 mm) in depth. Accept after repair subject to satisfactory crack detection.

B. Inspect Engine Trunnion Spigot Stem and Bore.

CAUTION: THE SPIGOT STEM ROOT IS A CRITICAL AREA. (Ref Fig.303). SPECIAL ATTENTION MUST BE PAID TO THIS AREA FOR SIGNS OF DAMAGE DURING THE GENERAL OVERALL INSPECTION.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Light witness mark on stem. Accept.

(b) Any elongation of locking pin-holes. Reject.

(3) Isolated scores, scratches, gouges.

(a) Not more than 0.020 in. (0,508 mm) deep in the spigot stem. Accept after repair.

(b) Not more than 0.010 in. (0,254 mm) deep in the spigot stem bore. Accept after repair.

(4) Scores, gouges, wear in pin hole.

(a) Not more than 0.005 in. (0,127 mm) deep. Accept after repair.

(5) General damage at edge of pin hole.

(a) Not more than 0.010 in. (0,254 mm) deep. Accept after repair.

C. Inspect Mounting Flange Body.

(1) Isolated scores, scratches, gouges.

(a) Not more than 0.020 in. Accept after  
(0,508 mm) deep. repair.

(2) Overheating. Reject for hardness  
checks.

(3) Paint flaking Reject for repair  
(Ref.72-09-04,  
Repair).

D. Inspect Mounting Flange/Spigot Stem Radius (Zone A).

(1) Circumferential or axial scores/scratches.

(a) Not more than 0.005 in. Accept after  
(0,127 mm) deep. repair.

(b) More than 0.005 in. Hold in  
(0,127 mm) but not quarantine.  
greater than 0.020 in.  
(0,508 mm) deep.

(c) More than 0.020 in. Reject.  
(0,508 mm) deep.

E. Inspect Headless Pin.

(1) Nicks and burrs. Accept after  
repair.

(2) Damage. Reject.

F. Inspect for Corrosion.

(1) Inspect mounting trunnion for corrosion especially  
in the spigot radius (ref. Fig.302 zone A).

(a) Not more than 0.005 in. Accept after repeat  
(0,127 mm) deep. cleaning and/or  
local blending  
(ref. 72-09-22  
Repair).

ENGINE MOUNTING TRUNNIONS - REPAIR  
REMOVAL OF CRACKS IN FLANGE BY BLENDING AND POLISHING

MODIFICATION NO. OL.8920C

1. Effectivity

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
71-20-00	1 60	B507464

2. Introduction

A. General.

- (1) This repair describes the procedure to remove minor cracks in the front flange of the mounting trunnions by blending and polishing.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micrometres) unless otherwise stated.
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.

B. Repair Limitations.

- (1) Blending and polishing to remove cracks may only be carried out in the areas marked ZONE B, and to a maximum depth of 0.020 in. (0,51 mm) (Ref. Figs.401 and 402).

### 3. Instructions

CAUTION: DURING REPAIR OF THIS COMPONENT, ITS SURFACES MUST BE PROTECTED FROM CORROSION AT ALL TIMES. WORK TO PROCEDURE DETAILED IN 72-09-20 REPAIR, USING DEWATERING FLUID.

#### A. Remove Coating.

- (1) Remove the existing Sermetal W coating using cleaning process F, as detailed in 72-09-00 Cleaning.

#### B. Inspect.

- (1) Inspect the trunnion for cracks using the magnetic particle process specified for this component in 71-20-00 Inspection/Check.

#### C. Remove Cracks.

- (1) Hand dress to remove the cracks within the limitations of the repair (Ref. paragraph 2B). Grinding must not be used.

#### D. Polish.

- (1) Polish the area dressed in the previous operation, to achieve a surface finish of 16 micro-inches (0,4 micrometres).

#### E. Etch.

- (1) Mask off and locally swab etch the dressed and polished area. Do not allow etchant to encroach onto areas not polished. For procedure, refer to 72-09-14 Repair, using solution B.

#### F. Inspect.

- (1) Inspect the trunnion for cracks using the magnetic particle process specified for this component in 71-20-00 Inspection/Check.

#### G. Identify.

- (1) Mark SAL B510768 or R1 adjacent to the existing part number, using vibro-percussion engraving as specified in 72-09-00 Repair.

H. Abrasive Blast.

- (1) Dry abrasive blast the trunnion all over except where indicated AG in Figure 403. Use aluminium oxide grit 300 to 500 mesh at 2N Almen intensity. For procedure, refer to 72-09-24 Repair.

J. Apply Coatings.

- (1) Apply a Sermetel W coating (OMat 7/46) to the trunnion all over except where indicated AG and AH in Figure 403. For procedure, refer to TSD 594 OP 349 (type A), but without uniblasting. Stove at 515 deg.C for four hours.
- (2) Apply a Sermaseal coating (OMat 7/168) to the areas coated with Sermetel W. For procedure, refer to TSD 594 OP 349.

K. Final Inspection.

- (1) Inspect the trunnion to ensure that the repair has been carried out satisfactorily and that the trunnion is in a serviceable condition.

L. Protect.

- (1) Apply temporary protection all over the trunnion, using lanolin/white spirit as instructed in 72-09-20 Repair.

4. Special Tools, Fixtures and Equipment

None.

5. Replacement Parts

None.

MOUNTING TRUNNION  
PROVISION FOR REMOVAL OF CORROSION FROM  
FRONT AND REAR FLANGE MOUNTING HOLES

REPAIR NO. B.513506

1. EFFECTIVITY

I.P.C.	Fig./Item	Part No.
71-20-00	1 060A 060B	B480959 B507464

2. REPAIR LIMITATIONS

Compliance with all aspects of this repair process should be achieved without deviation. Where a need to deviate is considered necessary reference should be made to the repair authority for agreement.

Repairable limits on holes prior to repair as follows:

PART A: Corrosion in front flange 2 off 0.500/0.501 (12,70/12,73) diameter dowel holes up to a depth of 0.005 (0,127) and not more than 1/3rd of the total surface area.

PART B: Corrosion in front flange 6 off 0.469 (11,91) diameter bolt holes up to a depth of 0.005 (0,127).

PART C: Corrosion in rear flange 11 off 0.3125/0.3134 (7,94/7,96) diameter fitted bolt holes up to a depth of 0.005 (0,127).

Front flange dowel holes are acceptable within above limits but must be processed in accordance with part 'A' of the following procedure.

Front and rear flange mounting bolt holes with corrosion in excess of the above may be repaired in accordance with the following Parts 'B' and 'C'.

### 4. REPAIR PROCEDURE

#### REPAIR PROCEDURE

#### SUPPLEMENTARY INFORMATION

CAUTION: DURING REPAIR THE SURFACES OF THIS COMPONENT MUST BE PROTECTED FROM CORROSION AT ALL TIMES. WORK TO PROCEDURE DETAILED IN OVERHAUL MANUAL 72-09-20 (REPAIR), USING DE-WATERING OIL.

- 1) Inspect, verify position and depth of corrosion. Proceed to Part A, B or C in accordance with Repair Limitations above. Ref fig.401.

#### PART A:

- 1) Strip paint and de-rust. Ref Overhaul Manual section 72-09-00 (Cleaning) process H. Table 208.
- 2) Crack detect defective holes. Ref Overhaul Manual section 72-09-00 (Inspection/Check). Using fluorescent dye penetrant process F3A.

NOTE: At this point it is permissible to effect SB 0L.593-71-8885-31, if applicable. Mark identity SAL B513506/A or R2A adjacent to new part number introduced by SB 0L.593-71-8885-31.

If SB 0L.593-71-8885-31 is not to be effected then proceed as follows:

**OLYMPUS 593**

## ENGINE HEATSHIELDS - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

4. Heatshield Assembly (302-40/240, 303-10/40, 304-10/70/130/200/  
270, 305-10/80/140/200/260, 307-10, 308-10)

A. Inspect Captive Nuts and Bolts (Ref.72-09-00 Inspection/  
Check).

(1) Security.

(a) Retaining plates secure                      Accept.  
and solid rivets  
positive.

B. Inspect Heatshield Contact Faces.

(1) Wear and fretting.

(a) Not more than 5 per                      Accept after  
cent reduction in                      repair.  
material thickness  
and unstepped wear.

C. Inspect Heatshield.

(1) Dents.

(a) Dents of smooth                      Accept after repair  
contour.                      providing repair  
does not induce  
cracking.

(2) Gouges.

(a) Not more than 0.005 in.                      Accept after  
(0,130 mm) in depth                      repair.  
with no removal of  
metal.

(3) Wear.

(a) Bolt-holes elongated                      Accept after repair  
not more than 0.030 in.                      providing repair  
(0,760 mm).                      does not induce  
cracking.

(4) Cracks.

(a) Any signs of cracking.                      Reject.

INSPECTION/CHECK

71-32-00

OVERHAUL

(5) Distortion.

Accept if compatibility is preserved.

(6) Punctures.

Reject for repair.

D. Inspect Rounded and Lipped Edges.

(1) Dents.

(a) Minor dents.

Accept after repair providing repair restores profile and does not induce cracking.

(2) Nicks.

(a) Not more than 0.010 in.  
(0,2540 mm) in depth.

Accept after repair subject to satisfactory crack detection.

E. Inspect External Finish.

(1) Peeling or damage  
of gold paint.

Accept after touch-up or re-finish (Ref. 72-09-03 Repair for areas of finish and application of finish).

5. Knitmesh Damper (302-90/110/200/270/290/380, 304-40/60/100/120/160/180/230/250/300/320, 305-40/60/110/130/170/190/230/250/290/310, 307-50/70, 308-40/60)

A. Inspect Knitmesh Damper.

(1) Check compression rate using spring test equipment  
(Ref. 72-09-00 Inspection/Check).

(a) Free length 0.150 in.  
(3,810 mm).

Accept.

(b) Fitted length 0.100 in. Accept.  
(2,540 mm).

(c) Load at fitted length Accept.  
5 to 15 lbs (2,27 to  
6,80 kg) i.e. spring  
rate of 100 to 300 lb/  
in. (17,56 to 52,68 N/mm).

(2) Damage.

(a) Disintegration of mesh. Reject.

6. Brackets (304-265, 306-10/70/170/220/270/320/370/420, 307-120/130, 308-70/110) and Channel Assembly (305-75)

A. Inspect Attachment Faces.

(1) Wear and fretting.

(a) Not more than 10 per cent reduction in flange thickness. Accept.

(b) Bolt-holes elongated not more than 0.030 in. Accept after repair.  
(0,760 mm).

(2) Scores.

(a) Not more than 0.010 in. Accept after repair  
(0,250 mm) in depth. providing flange thickness is not reduced by more than 10 per cent.

B. Inspect Bracket.

(1) Nicks and burrs. Accept after repair.

(2) Distortion. Accept if compatibility is preserved.

C. Inspect Captive Nuts and Plain Plate Nuts (Ref.72-09-00 Inspection/Check).

(1) Security.

(a) Solid rivets positive and nuts secure. Accept.

## HEAT SHIELDS - COMBUSTION CHAMBER OUTER CASE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

**71-32-01**

Page 201

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

2. Introduction

## A. General.

- (1) This instruction describes the procedure for repairing the combustion chamber outer casing heat shield by direct welding, patching or blending where fretting or cracking has occurred.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,50 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in (0,25 mm) unless otherwise stated.

## B. Repair Limitations.

- (1) Compliance with all aspects of these repairs should be achieved without deviation. Where a need to deviate is considered necessary, agreement should first be sought from the Repair Authority.
- (2) There are three separate parts to this repair procedure:
  - (a) Repair by blending minor edge defects up to 0.187 in. (4,75 mm) in length (Part 1).
  - (b) Repair by direct welding single cracks (Part 2).

Jun 1/91

OLYMPUS 593

MK.610-14-28

OVERHAUL

(c) Repair by patching branch cracking and areas that cannot be repaired by direct welding (Part 3).

(3) The Heat Shield material specification is stainless steel to MSRR 6523, Rolls-Royce code EBM.

### 3. Instructions.

#### A. Assessment of Repair.

Inspect the component to determine the extent of any damage then refer to the relevant instructions below.

(1) Repair by Blending (Part 1).

(a) Blend.

1 Refer to Figure 401. Removing only the minimum amount of material necessary, hand blend to remove damage within the limitation given, to produce a smooth continuous profile with no sharp edges.

(b) Inspect.

1 Carry out crack detection as specified for this component in Chapter 72-09-00, FlA, Inspection/Check.

(c) Identify.

1 Mark the component SAL B513550/1 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

(2) Repair by Welding (Part 2).

(a) Preparation.

1 Refer to Chapter 72-09-03, Repair. Locally remove gold paint from area to be welded.

2 Refer to TSD 594-409. Thoroughly clean and prepare the area for welding.

REPAIR

OVERHAUL

## (b) Weld.

- 1 Refer to TSD 594-409. Using filler rods to MSRR 9500/2, repair cracks by welding.

NOTE: Take suitable precautions to prevent distortion during welding.

## (c) Inspect.

- 1 Check component for distortion.
- 2 Carry out crack detection as specified for this component in Chapter 72-09-00, FlA, Inspection/Check.

## (d) Restore Finish.

- 1 Referring to Chapter 72-09-03, Repair, touch up gold paint locally.

## (e) Identify.

- 1 Mark the component SAL B513550/2 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

## (3) Repair by Patching (Part 3).

## (a) Preparation.

- 1 Cut away the defective area ensuring minimum corner radii of 0.500 in. (12,70 mm).
- 2 Using patch material to MSRR 6523 (0.019 to 0.025 in. (0,48 to 0,64 mm) thick before forming), prepare a flush fitting patch to suit the contours of the cut away area (see para. 5 Replacement Parts, of this instruction).
- 3 Refer to Chapter 72-09-03, Repair. Locally remove gold paint from area to be welded.
- 4 Refer to TSD 594-409. Thoroughly clean and prepare the area for welding.

OVERHAUL

(b) Weld.

- 1 Refer to TSD 594-409. Using filler rods to MSRR 9500/2 argon arc weld patch in position.

NOTE: Take suitable precautions to prevent distortion during welding.

(c) Inspect.

- 1 Carry out crack detection as specified for this component in Chapter 72-09-00, F1A, Inspection/Check.

(d) Dress.

- 1 Dress the patch flush to existing contour taking care that parent material is not impaired.

(e) Inspect.

- 1 Carry out crack detection as specified for this component in Chapter 72-09-00, F1A, Inspection/Check.

(f) Restore Finish.

- 1 Refer to Chapter 72-09-03, Repair. Touch up gold paint locally.

(g) Identify.

- 1 Mark the component SAL B513550/3 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

C. Final Inspection.

- (1) Finally inspect component to ensure that repair has been carried out satisfactorily and that the Heat Shield is in a serviceable condition.

4. Special Tools, Fixtures and Equipment

None.

5. Replacement Parts

BR50909 Patch Material Qty as required.

## HEAT SHIELDS - TURBINE EXHAUST DIFFUSER - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum, but repeat the process a number of times until the assembly item is satisfactorily cleaned. If the finish is damaged, then the damaged part will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the controlling laboratory. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

2. Introduction

## A. General.

- (1) This repair describes the procedure for repairing the turbine exhaust diffuser heat shield by direct welding, patching or blending where fretting or cracking has occurred.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES), in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair procedure.
- (4) Remove all sharp edges 0.004 to 0.020 in. (0,10 to 0,50 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in (0,25 mm) unless otherwise stated.

## B. Repair Limitations.

- (1) Compliance with all aspects of these repairs should be achieved without deviation. Where a need to deviate is considered necessary, agreement should first be sought from the Repair Authority.

Repair No. 1

Page 401

Jun 1/91

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (2) There are three separate parts to this repair procedure:
  - (a) Part 1. Repair by blending minor edge defects up to 0.187 in. (4,75 mm) in length.
  - (b) Part 2. Repair by welding single cracks.
  - (c) Part 3. Repair by patching branch cracking and areas that cannot be repaired by direct welding.
- (3) The heat shield material specification is Titanium to MSRR 8608, Rolls-Royce code TAK.

### 3. Instructions

A. Inspect the component to determine the extent of any damage then refer to the appropriate instructions below.

#### (1) Repair by Blending (Part 1).

##### (a) Blend.

- 1 Refer to Figure 401. Removing only the minimum material, hand blend to remove damage and produce a smooth continuous profile.

##### (b) Inspect.

- 1 Carry out crack detection test using procedure specified at Chapter 72-09-00, F1A, Inspection/Check.

##### (c) Identify.

- 1 Mark the component SAL B513551/1 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

#### (2) Repair by Welding (Part 2)

##### (a) Preparation.

- 1 Referring to Chapter 72-09-00, Repair, locally remove gold paint from area to be repaired.

REPAIR

71-32-02

Repair No. 1

Page 402

Jun 1/91

OLYMPUS 593

MK.610-14-28

OVERHAUL

- 2 Refer to TSD 594-409. Thoroughly clean and prepare the damaged area for welding.

(b) Weld.

- 1 Refer to TSD 549-409. Using filler rods to MSRR 9500/70 repair cracks by welding.

NOTE: Take suitable precautions to prevent distortion during welding.

(c) Inspect.

- 1 Check component for distortion.
- 2 Carry out crack detection test using procedure specified at Chapter 72-09-00, FlA, Inspection/Check.

(d) Restore Finish.

- 1 Refer to Chapter 72-09-03, Repair, and touch up gold paint locally.

(e) Identify.

- 1 Mark the component SAL B513551/2 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

(3) Repair by Patching (Part 3).

(a) Preparation.

- 1 Cut away the defective area ensuring minimum corner radii of 0.500 in. (12,70 mm).
- 2 Using patch material to MSRR 8608 (0.019 to 0.025 in. (0.48 to 0,64 mm) thick before forming), prepare a flush fitting patch to suit the contours of the cut away area (see para. 5 Replacement Parts, of this instruction).
- 3 Refer to Chapter 72-09-03, Repair. Locally remove gold paint from area to be welded.

REPAIR

OVERHAUL

- 4 Refer to TSD 594-409. Thoroughly clean and prepare the area for welding.

(b) Weld.

- 1 Refer to TSD 594-409. Using filler rods to MSRR 9500/70 argon arc weld patch in position.

NOTE: Take suitable precautions to prevent distortion during welding.

(c) Inspect.

- 1 Check for distortion and manipulate to maintain existing contours.
- 1 Carry out crack detection as specified for this component in Chapter 72-09-00, FlA, Inspection/Check.

(d) Dress.

- 1 Dress the patch flush to existing contour taking care that parent material is not impaired.

(e) Inspect.

- 1 Carry out crack detection as specified for this component in Chapter 72-09-00, FlA, Inspection/Check.

(f) Restore Finish.

- 1 Refer to Chapter 72-09-03, Repair. Touch up gold paint locally.

(g) Identify.

- 1 Mark the component SAL B513551/3 adjacent to the existing part number using vibro-percussion engraving marking as specified in Chapter 72-09-00, Repair.

C. Final Inspection.

- (1) Finally inspect component to ensure that repair has been carried out satisfactorily and that the Heat Shield is in a serviceable condition.

OVERHAUL

ENGINE ELECTRICAL CABLES - DISASSEMBLY1. General

- A. Prior to commencing the disassembly, refer to 71-09-00 Disassembly for general information.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for disassembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. The procedures for the removal of the engine electrical harness from the power plant are detailed in 71-00-02 Electrical Harness, Ignition Leads and Vibration Transducer Cable, Removal from the Engine.
- D. This chapter contains the procedure for the disassembly of the engine electrical cables, after removal from the engine, to the extent required for cleaning and inspection. Also included in this text is the procedure for disassembly required to replace an unacceptable item following inspection or trouble shooting.

2. Disassembly of the Electrical Cables

## A. General.

The complete engine electrical cables comprises seven multi-cable looms. The cables are to be treated as fragile and care is to be taken when handling.

## B. Disassembly of the Cables into Separate Harness Looms.

- (1) Carefully remove the complete electrical harness from the transportation container and place on a table.
- (2) Carefully remove the Rapidon bindings and lacing braid securing the separate branches.
- (3) Remove the sealing rings from the plugs.
- (4) Remove the transportation straps or bindings securing the looms together.

NOTE : The harness is now considered to be disassembled, further disassembly is only to be performed at the discretion of inspection or trouble shooting procedures.

DISASSEMBLY

MK.610-14-28  
OVERHAUL

C. Disassembly of Electrical Harness Plugs (Ref.Fig.101).

NOTE: This disassembly is only to be performed when required, at the discretion of inspection or trouble shooting procedures.

- (1) Remove the lockwire securing the two screws to the plug end bell.
- (2) Remove the lockwire securing the plug end bell to the plug body.
- (3) Remove the two screws securing the clamp to the plug end bell and remove the two half clamps, or slide the telescopic sleeves away from the plug, whichever is appropriate.
- (4) Unscrew the plug end bell from the plug body and slide clear of the plug.
- (5) Withdraw all the contacts from the plug body using the insert/extractor tool (Tool 2701).
- (6) Remove the plug end bell from the cable and retain all removed items together.

D. Removal of Electrical Harness Cables.

NOTE: This disassembly is only to be performed when required, at the discretion of inspection or trouble shooting procedures.

- (1) Identify the cable to be removed by referring to the wiring diagrams (Ref.Fig.102 through 107 and Table 101).
- (2) At both the engine disconnect end and the component end of the cable, remove the lockwire securing the two screws to the plug end bell (Ref.Fig.101).
- (3) Remove the lockwire securing the plug end bell to the plug body.

## ENGINE ELECTRICAL CABLES - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

PRINTED IN ENGLAND

## ENGINE ELECTRICAL CABLES - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

**71-51-01**

Page 301

4. Harness Wiring Assembly (302-10/20/30/40/50/60)

A. Inspect Lacing and Harness Binding.

NOTE: Pay particular attention to the loop clamp locations when checking for wear (Ref.Fig.302).

(1) Damage.

- |  |   |
|--|---|
| (a) Harness binding free from fraying and lacing intact. | Accept subject to insulation checks (Ref.71-00-02 Testing). |
|--|---|

OVERHAUL

B. Inspect Cable.

NOTE: Where practicable inspect the cable at the loop clamp locations when checking for wear (Ref.Fig.302).

(1) Damage.

- |   |   |
|---|---|
| (a) Cables free from cuts, fraying or disintegration of insulation. | Accept subject to insulation checks (Ref.71-00-02 Testing). |
|---|---|

C. Carry out Insulation and Continuity Checks (Ref.71-00-02 Testing).

5. Tray Assembly (308-180/290, 310-230, 311-200)

A. Inspect Captive Nuts (Ref.72-09-00 Inspection/Check).

(1) Security.

- |   |         |
|---|---------|
| (a) Nut retainers secure and solid rivets positive. | Accept. |
|---|---------|

B. Inspect Loop Clamp Attachment Bosses.

- |                      |                      |
|----------------------|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
|----------------------|----------------------|

(2) Wear.

- |  |                      |
|--|----------------------|
| (a) Not more than 10 per cent reduction in material thickness. | Accept.              |
| (b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).   | Accept after repair. |

C. Inspect Attachment Flanges.

- |                      |                      |
|----------------------|----------------------|
| (1) Nicks and burrs. | Accept after repair. |
|----------------------|----------------------|

(2) Wear.

- |   |         |
|---|---------|
| (a) Not more than 5 per cent reduction in material thickness. | Accept. |
|---|---------|

OVERHAUL

- (b) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

D. Inspect Tray Assembly.

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Distortion.

Accept if com-  
patibility is  
preserved.

6. Bracket (310-60, 311-100/280, 312-250) and Mounting  
Plate (312-110)

A. Inspect Attachment Faces.

- (1) Wear and fretting.

- (a) Not more than 10 per  
cent reduction in  
material thickness.

Accept.

- (b) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

- (2) Scores.

- (a) Not more than 0.010 in.  
(0,250 mm) in depth.

Accept after repair  
providing material  
thickness is not  
reduced by more  
than 10 per cent.

B. Inspect Brackets.

- (1) Nicks and burrs.

Accept after  
repair.

- (2) Distortion.

Accept if com-  
patibility is  
preserved.

- (3) Wear.

- (a) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

7. Block (311-20/30/50/70/90)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Block.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Not more than 5 per  
cent reduction in  
material thickness.

Accept providing  
90 per cent of  
effective designed  
profile is  
maintained.

(b) Bolt-holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

8. Harness Support Assembly (312-10/30/40/50)

A. Inspect Support Assembly.

(1) Inspect for general  
condition.

Accept if  
serviceable.

9. Paragraph deleted.

10. Straight Free Plug (313-30/70/110/150/180/240/270, 314-20/70/120/160/200/240/280/330/400, 315-20/70/110/150/230, 316-20/60/140/220, 317-20/70/120/200, 318-20/60/110/150/220)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

NOTE: Check run-down of thread on the mating component.

B. Inspect Contact Sockets and Contact Pins.

(1) Damage to pin locations and pins.

(a) Any damage.

Reject for repair  
(Ref.71-51-01  
Assembly).

C. Inspect Plug.

(1) Nicks and burrs.

Accept after  
repair.

(2) Distortion.

(a) Any distortion to cable  
clamp supports.

Reject.

INSPECTION/CHECK

71-51-01

Page 308

OVERHAUL

sneema

**D. Inspect Telescopic Bush.**

- (1) Torn or broken bushes.

Reject for replacement (Ref.71-51-01 Assembly).

- (2) Swelling.

- (a) Any signs of swelling due to oil contamination.

Reject for replacement (Ref.71-51-01 Assembly).

**E. Inspect Cable Clamps and Half Clamps.**

- (1) Nicks and burrs.

Accept after repair.

- (2) Distortion.

Accept if compatibility is preserved.

**F. Inspect Cable for Security to Plug.**

- (1) Security.

- (a) Cable secure.

Accept.

- (b) Cable detached from contact sockets or contact pins.

Reject for repair (Ref.71-51-01 Assembly).

**G. Check Effectiveness of Locking Device.**

**NOTE:** Use a new Straight Free Plug as a comparison when determining the degree of resistance of the clicker lock i.e. with thumb and forefinger, exert turning pressure on the knurled connector until the locking device operates through one serration. The comparison should be used to determine the effectiveness of the locking device on the Straight Free Plugs submitted for overhaul inspection and must therefore be the acceptance standard.

- (1) Locking device positive.

Accept.

INSPECTION/CHECK

H. Peripheral Sealing Ring.

NOTE: The Peripheral Sealing Ring, irrespective of condition, must be renewed at each overhaul.

J. Inspect Plug Core.

NOTE: Check that Seal Plugs (313-310, 314-390/410, 315-210/270, 316-200/260, 317-190/240, 318-210/260) are still in place in the vacant cable positions in the rear of the Straight Free Plug.

(1) Swelling.

(a) Any swelling due to oil contamination.

Reject for replacement (Ref.71-51-01 Assembly).

K. Inspect Wire-lock Holes.

NOTE: Two wire-lock holes are drilled to supplement the clicker lock device, each straight free plug must have at least one positive unbroken wire-lock hole.

(1) Unbroken wire-lock hole.

Accept.

ELECTRICAL CABLES - REPAIR BY SPLICING, SHRINK  
SLEEVING, AND WRAPPING  
MODIFICATION OL.8520 (C)

1. Effectivity

<u>I.P.C.</u>	<u>Fig./Item</u>	<u>Part Description</u>
71-51-01	1 1A	Single core size 20 and size 16 cables (para.3). Single or multicore size 20 and size 16 cables screened and jacketed (para.4). Low noise cables, screened and jacketed (para.5). Single and multicore fireproof cables screened and jacketed (para.6). Single fireproof cables jacketed (para.7).

2. Introduction

A. General.

- (1) This repair facilitates simple rectification of damaged cables within the loom and avoids replacing long lengths of cable.
- (2) The repair embodies the procedures for salvaging five different types of cable, reference Para.1 Effectivity Part Description.
- (3) Several of the five types of cable included in this repair can be repaired to alternative salvages; the salvage used is determined by the location of the damage within the cable loom, and the facilities available.
- (4) Each of the methods used, are identified by a suffix letter added to the salvage number, i.e. the third method of repairing the first type of cable listed is identified thus: B.493642C.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (5) Figures and Tables applicable to these salvages are positioned on the page following their initial reference, where two initial quotes appear on the same page they follow in their order of reference.
- (6) Materials necessary to accomplish these repairs are tabled with each repair group; a list of tool manufacturers and suppliers are contained in table form, reference para.8.
- (7) Dimensions are shown thus INCHES (MILLIMETRES).
- (8) A log book entry stating the salvage number, its suffix letter and the circuit title, shall be made after embodiment of each repair.

B. Repair Limitations.

- (1) Not more than two crimp joints shall be used in any one cable run and crimp joints must not be located at cable bends.
- (2) All cables repaired using these salvages shall be subjected to and comply with their relevant electrical circuit test (Ref.71-00-02, Testing).
- (3) During re-attachment of repaired cables, to the cable loom, all securing nuts disturbed to facilitate these repairs shall be torque loaded (Ref.71-00-02, Assembly).
- (4) Ensure that all safety precautions, warnings, applicable whilst working on Polytetrafluoroethylene (PTFE) are strictly adhered to.
- (5) An aircraft dressing item, side tray and clamp is located in the engine bay and secures the engine electrical cables prior to the main connector block. It is important that no cable repairs are carried out within 18.00 in. (427,2 mm) of the main break connectors at the aircraft/engine face. At other connections/terminations within the harness the only limitation being the accessibility of the appropriate tools.

### 3. Repair Single Core Size 20 and Size 16 Cables

WARNING: HEALTH HAZARD. MATERIALS USED IN THESE REPAIRS ARE COMPOSED OF POLYTETRAFLUOROETHYLENE (PTFE). THIS MATERIAL WILL EMIT TOXIC GASES WHEN SUBJECTED TO TEMPERATURES ABOVE 340 DEG C, THE HIGHER THE TEMPERATURE THE GREATER THE EMISSION OF TOXIC GAS. ADEQUATE VENTILATION IS TO BE PROVIDED WITHIN THE WORK AREA AND CLOSE TO THE HEATING SOURCE.

#### A. Salvage B.493642A.

##### (1) Limitations.

- (a) This salvage to be confined to cables with damaged insulation not exceeding 0.600 in. (15,24 mm) in length, and where there is sufficient room in the area of damage to operate the necessary tools to effect the repair.
- (b) Ensure that the splice positions do not coincide with a clamp loop position.
- (c) The salvage is to comply with the layout in Figure 401.
- (d) Use only materials specified in Table 401.

##### (2) Procedure.

- (a) Cut the cable at the centre of the damaged area, using conventional wire cutters.
- (b) Determine the applicable 'Y' dimension by comparison of Figure 401 and Table 401.
- (c) Remove the cable insulation from the newly cut cable ends and produce the calculated 'Y' dimension, use an Ideal Stripmaster.

MK.610-14-28

OVERHAUL

- (d) Inspect the stripped ends of the cable to ensure that the core strands are free from damage, that the insulation is cleanly severed and ascertain that the required 'Y' dimension length has been obtained.
- (e) Select, from the splice kit (Table 401), the correct sleeve and supplementary sleeves, then slide them over the cable and position them each side of the repair.
- (f) Select the appropriate single post insulated butt splice (part of splice kit), then insert the conductor cable ends in the butt splice.
- (g) With the conductors abutting at the central indentation of the insulated butt splice, crimp the splice to the conductor cable using the correct crimping tool selected from Table 401.
- (h) Slide the sleeves over the repair area as shown in Figure 401 and crimp through the supplementary sleeves to the cable.
- (j) Visually inspect the crimped areas, then secure the cable to its original cable run or loom with the previously used securing clips and lacing.
- (k) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

B. Salvage B.493642B.

NOTE: This is an alternative to salvage B.493642A and introduces a shrink sleeve in place of a crimped sleeve, to restore the cable insulation.

(1) Limitations.

- (a) This salvage to be confined to cables with damaged insulation not exceeding 0.600 in. (15,24 mm) in length and where there is sufficient room in the area of damage to operate the necessary tools to effect the repair.

TN2417

OLYMPUS 593

MK.610-14-28

OVERHAUL

- (b) Ensure that the splice positions do not coincide with a clamp loop position.
  - (c) The salvage is to comply with the layout in Figure 402.
  - (d) Use only materials specified in Table 401.
- (2) Procedure.
- (a) Cut, strip and inspect the cable as detailed in para.3.A.(2)(a) to (d) but refer to Figure 402.
  - (b) Select, from the splice kit (Table 401), the correct size shrink sleeve and position it over one end of the cable at a neutral position, near to the repair area.
  - (c) Select the appropriate single post insulated butt splice from the splice kit (Table 401), then insert the conductor cable ends in the butt splice.
  - (d) With the conductors abutting at the central indentation of the insulated butt splice, crimp the splice over the conductor cable using the correct crimping tool selected from Table 401.
  - (e) Position the shrink sleeve centrally over the repair area and the core splice as shown in Figure 402, then apply the heat shrink procedure to the PTFE sleeve. For heat shrinking instructions of PTFE sleeves refer to para.8.B.
  - (f) Visually inspect the repaired areas, then secure the cable to its original cable run or loom with the previously used securing clips and lacing.
  - (g) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

C. Salvage B.493642C.

NOTE: This salvage is complementary to schemes B.493642A and B and is implemented when damage to the insulation is reasonably close to a replaceable cable termination, reference Figure 403. The limitation reference para. 2.B.(5) must be adhered to when the cable termination is at one of the main break connectors.

(1) Limitations.

- (a) Ensure that the position of the splice location does not coincide with a clamp loop position.

(2) Procedure.

- (a) Withdraw the cable end from the termination point (Ref.71-00-02).
- (b) Cut the cable at a position beyond the damaged portion, then prepare the cable for fitment of a single post insulated butt splice as described for salvages B.493642A. or B.
- (c) Select a new length of cable and attach the appropriate termination point connector (Ref.71-00-02).
- (d) Complete the splice connection at the new splice point in accordance with scheme B.493642A. or B.
- (e) Visually inspect the repaired area, then re-install the cable in the harness and secure with the lacing and clipping used prior to this repair.
- (f) Subject the repaired cable length to electrical checks (ref.71-00-02, Testing).

D. Salvage B.493642D.

NOTE: This salvage is complementary to salvages B.493642A. and B and is implemented where the damaged area is located in the middle of a cable run, or isolated from a convenient termination point reference Figure 404.

(1) Limitations.

- (a) Ensure that the position of the splice locations do not coincide with clamp loop positions.
- (b) Where more than one cable has been damaged splices must be staggered.
- (c) No more than two splice connectors are to be used in any one length of cable.

(2) Procedure.

- (a) Cut out the damaged section of the cable at a convenient point either side of the damaged area, and where the tools necessary to effect the repair can be operated.
- (b) Splice in a new section of suitable length cable, using two single post insulated butt splices and crimp or shrink sleeve the outer insulation as described for salvages B.493642A. or B.
- (c) Visually inspect the repaired area, then secure the cable run to the cable loom, attach the cable using all the relevant lacing and clamp loops; ensure that the new splice is laced into the cable loom.
- (d) Subject the repaired cable length to electrical checks (ref.71-00-02, Testing).

4. Repair Single or Multicore Size 20 and Size 16 Cables Screened and Jacketed

WARNING: HEALTH HAZARD. MATERIALS USED IN THESE REPAIRS ARE COMPOSED OF POLYTETRAFLUOROETHYLENE (PTFE). THIS MATERIAL WILL EMIT TOXIC GASES WHEN SUBJECTED TO TEMPERATURES ABOVE 340 DEG C, THE HIGHER THE TEMPERATURE THE GREATER THE EMISSION OF TOXIC GAS. ADEQUATE VENTILATION IS TO BE PROVIDED WITHIN THE WORK AREA AND CLOSE TO THE HEATING SOURCE.

A. Salvage B.493642E.

NOTE: This salvage is to be implemented where the damage is confined to the cable outer jacket, and is achieved by wrapping the damaged area with a suitable PTFE tape, reference Figure 405.

(1) Limitations.

- (a) Ensure that the damage is confined to the outer jacket.

(2) Procedure.

- (a) Obtain a single length of PTFE sealing tape (ref. Table 402) of sufficient length to carry out operations (b) and (c).
- (b) Commencing at a point approximately 1.50 in. (38,10 mm) from the damaged area, wrap the tape around the cable using a 50 per cent overlap of the PTFE tape to a point approximately 1.50 in. (38,10 mm) beyond the damaged area.
- (c) Without a break in the tape, wrap in the reverse direction, maintaining the 50 per cent overlap, to completely cover the first wrap and finish neatly at the starting point.
- (d) Secure the end of the PTFE sealing tape using lacing braid (ref. Table 402) with clove hitch and reef knot. Seal the knot with Silicone varnish.

MK.610-14-28  
OVERHAUL

- (e) Visually inspect the repaired area, then secure the cable into the cable loom and cable run using the relevant lacing and clamp loops.
- (f) Subject the repaired length to electrical checks (ref.71-00-02, Testing).

B. Salvage B.493642F.

NOTE: This salvage is to be implemented where both the outer jacket and screen is damaged, provided that the screen function is not seriously impaired, and not more than 50 per cent of the braid strands are broken (ref. Figure 406).

(1) Limitations.

- (a) Ensure that the damage is limited to the outer jacket and screen braiding only.

(2) Procedure.

- (a) Comb out and re-lay the damaged screen braid, to cover the maximum area of the exposed cable; curl the braid strand ends outwards to avoid penetration of the core insulation.
- (b) Starting at a point approximately 0.500 in. (12,70 mm) from one end of the damaged area and using glass cloth tape (ref.Table 402), wrap the cable to a point approximately 0.500 in. (12,70 mm) beyond the other end of the damaged area. Maintain a 50 per cent overlap of the tape width during the wrapping.
- (c) Commencing at a point approximately 1.00 in. (25,00 mm) from the edge of the glass cloth tape and using PTFE tape (ref.Table 402), wrap the cable and the glass cloth tape; maintain a 50 per cent overlap to a point approximately 1.00 in. (25,00 mm) beyond the far edge of the glass cloth tape. Without a break in the tape, wrap in the reverse direction maintaining the 50 per cent overlap and finish neatly at the starting point.

- (d) Secure the end of the PTFE tape using lacing braid (ref. Table 402) with clove hitch and a reef knot, seal the knot with Silicone varnish.
- (e) Visually inspect the repaired area, then secure cable into the cable loom and cable run using the relevant lacing and clamp loops.
- (f) Subject the repaired cable length to electrical checks (ref. 71-00-02, Testing).

C. Salvage B.493642G.

NOTE: This salvage is to be implemented to screened and jacketed cables where damage to the core insulation does not exceed 0.600 in. (15,24 mm) in length in any one cable core, and where there is sufficient room in the area of damage to operate the necessary tools to effect the repair.

(1) Limitations.

- (a) Multicore cable splices are to be staggered by twice the splice length.
- (b) Not more than two splices to be installed in any one cable core.
- (c) Ensure that the repair area does not coincide with a clamp loop position.

(2) Procedure.

- (a) Cut away sufficient outer jacket insulation to expose 3.50 in. (87,5 mm) of the screen braid, then remove 3.00 in. (75 mm) of the screen braid; leaving approximately 0.25 in. (6,25 mm) of braid protruding from each end of the insulation at the extremes of the repair area; refer to Figure 407 for repair detail and dimensions.
- (b) Cut through the cable cores at their appropriate staggered positions.

OVERHAUL

- (c) Locate a length of correct size shrink sleeve over the cable followed by two correct size solder sleeves and a suitable length of axially compressed screen braid (ref. Table 402); position the parts at a convenient neutral point away from the cable repair area.
- (d) Taking each cable end in turn and using the Ideal Stripmaster, strip the cable ends to expose sufficient of the conductor to accommodate the butt splices.
- (e) Locate on the cores, at the longest exposed sections, the correct size shrink sleeves.
- (f) Select the appropriate butt splice and crimp tool from Table 402, then insert conductor ends in the butt splice.
- (g) With the conductors abutting at the central indentation of the splices, crimp the splices over the conductors using the correct crimp tool.
- (h) Position the shrink sleeves centrally over the splice connectors and shrink into position; refer to para.8.A. for the heat shrink techniques.
- (j) Position the length of screen braid centrally over the repair area; ensure that the 0.25 in. (6,35 mm) overlap at the braid ends is maintained and that the bare ends of the braid are turned outwards, avoiding penetration of the core insulation.
- (k) Locate the solder sleeves over the 0.25 in. (6,35 mm) cable braiding, at both ends of the repair area, reference Figure 407, then trim off any excess braid, and finally solder into position; refer to para.8.B. for soldering details.

OVERHAUL

- (l) When both ends of the braided cable has been soldered satisfactorily, position the shrink sleeve over the repair and shrink into position; refer to para.8.A. for the heat shrink techniques.
- (m) Visually inspect the repaired area, then secure the cable to its original cable run or bunch with the previously used securing clips and lacing. Ensure that the spliced area does not coincide with a clamp loop position.
- (n) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

#### D. Salvage B.493642G (Alternative).

NOTE : This salvage is implemented as an alternative salvage to that quoted in sub-para.C. This salvage permits the operator to use a PTFE tape wrapping in place of shrink sleeve at the cable outer insulation. Observe the Note and limitations at the commencement of sub-para.C.

#### (l) Procedure.

- (a) Carry out operations (a), (b) and (d) detailed in sub-para.C, but with reference to Figure 408.
- (b) Locate on the cable two correct size solder sleeves and a suitable length of axially compressed screen braid; position the parts at a convenient neutral point away from the cable repair area.
- (c) Carry out operations (e), (f), (g), (h), (j) and (k) detailed in sub-para.C.
- (d) Commencing approximately 1 in. (25,4 mm) from one end of the repair area, and using PTFE tape (ref. Table 402), wrap the cable and repair area and continue for approximately 1 in. (25,4 mm) beyond the repair area. Maintain a 50 per cent overlap of the tape during the wrapping. Without a break in the tape, wrap in the reverse direction maintaining the 50 per cent tape overlap, and finish neatly at the starting point.

OVERHAUL

- (e) Secure the end of the PTFE tape using lacing braid (ref. Table 402) with clove hitch and reef knots; seal the knot with Silicone varnish.
- (f) Visually inspect the repaired area, then secure the cable to its original cable run or loom with the previously used securing clips and lacing.
- (g) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

E. Salvage B.493642H.

NOTE: This salvage is to be implemented on screened and jacketed cables where extensive damage has been sustained close to a replaceable termination, and where there is sufficient room in the area of damage to operate the necessary tools to effect the repair; refer to Figure 409 for repair layout and Table 402 for suitable materials.

(1) Limitations.

- (a) Not more than two splices to be installed in any one cable core.
- (b) Multicore cable splices are to be staggered by twice the splice length.
- (c) Ensure that the intended splice location at the end of the in situ cable does not coincide with a clamp loop position.

(2) Procedure.

- (a) Withdraw the cable end from the termination point (Ref.71-00-02).
- (b) Cut the cable at the furthestmost side of the damaged area from the termination point, so that the damaged section is removed with the length of cable previously disconnected from the termination point; use conventional electrical wire cutters.

OVERHAUL

- (c) Cut away sufficient outer jacket insulation and screen braid from the end of the in situ length of cable; this is to accommodate the stripping of the conductor core(s) and the staggered length of cable for the butt splice(s) in a subsequent operation. Leave approximately 0.25 in. (6,35 mm) of screen braid protruding from beneath the outer jacket insulation.
- (d) Select a new length of replacement cable, prepare one end to accommodate the fittings required for attachment to the termination point, i.e. pins, socket contacts, etc. then attach the prepared end to the termination point (Ref.71-00-02).
- (e) Prepare the conductor core insulation and cable cores for attachment of the butt splice connectors; use the Ideal Stripmaster.

NOTE : Ensure when cutting multicore cable core(s), that allowance has been made for the staggered positions of the butt splice(s), then cut the cable core conductors to accommodate the butt splice(s).

- (f) Locate on the cable the correct size shrink sleeve, two correct size solder sleeves and a suitable length of axially compressed screen braid; position the parts at a convenient neutral point away from the cable repair area.

NOTE : The shrink sleeve is only to be used if alternative PTFE wrap (sub-para.F) is not used.

- (g) Locate on the core(s) the correct size core shrink sleeve(s).

REPAIR

71-51-01

Repair No.1

Page 425

Jun 1/98

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (h) Select the appropriate butt splice(s) and crimp tool, then insert conductor ends in the butt splice(s).
- (j) With the conductors abutting at the central indentations of the butt splice(s), crimp the splice(s) to the cable conductors using the correct crimp tool.
- (k) Carry out operations (h) to (l) as detailed in sub-para.C.
- (l) Visually inspect the repaired area, then secure the cable to its original cable run or loom with the previously used securing clips and lacing.
- (m) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

F. Salvage B.493642H (Alternative).

NOTE: This is an alternative to Salvage B.493642H and permits the use of PTFE tape wrapping in place of the shrink sleeve at the cable outer insulation; refer to Figure 410 for the repair layout and to Table 402 for the materials. Observe the limitations in sub-para.E.

(1) Procedure.

- (a) Carry out operations (a) to (k) detailed in sub-para.E, but omit reference to the assembling and soldering of the outer shrink sleeve.
- (b) Commencing approximately 1.0 in. (25,4 mm) from one end of the repair area, and using PTFE tape, wrap the cable and repair area and continue for approximately 1.0 in. (25,4 mm) beyond the repair area. Maintain a 50 per cent overlap of the PTFE tape during the wrapping. Without a break in the tape, wrap in the reverse direction maintaining the 50 per cent tape overlap, and finish neatly at the starting point.

- (c) Secure the end of the PTFE tape using lacing braid with clove hitch and reef knot; seal the knot with Silicone varnish.
- (d) Visually inspect the repaired area, then secure the cable to its original cable run or loom with the previously used securing clips and lacing.
- (e) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

G. Salvage B.493642J.

NOTE: This salvage is implemented on screened and jacketed cables, where damage cannot be rectified using salvage B.493642H (sub-para. E or F and where the damaged sustained in the cable run is not convenient to a termination point; refer to Figure 411 for repair layout.

(1) Limitations.

- (a) Not more than two splices to be installed in any one cable core.
- (b) Multicore cable splices are to be staggered by twice the splice length.

(2) Procedure.

- (a) Cut out the damaged length of cable at convenient points either side of the damaged area.
- (b) Adopting the method of attachment used in salvage B.493642H or its alternative, introduce a length of new cable between the in situ cable ends, using a butt splice connection at both ends of the new cable length.

- (c) Visually inspect the repaired area, then secure the cable to its original cable run or loom with the previously used securing clamps and lacing.
- (d) Subject the repaired cable length to electrical checks (Ref.71-00-02, Testing).

5. Repair Low Noise Cable, Screened and Jacketed

A. Salvage B.493642K.

NOTE: This salvage is implemented to low noise cables screened and jacketed, where the damage is confined to the outer jacket only; refer to Figure 412 for the repair layout and Table 403 for suitable materials.

(1) Procedure.

- (a) Remove all debris from the damaged area, then ensure that the damage is confined to the outer jacket, and that the materials beneath the outer jacket are free from damage.
- (b) Using the appropriate PTFE tape, and commencing 1.500 in. (38,1 mm) to one side of the damaged area, firmly wrap the 1.500 in. (38,1 mm) area of insulation, the damage section, and the insulation 1.500 in. (38,1 mm) beyond the other side of the damage. Maintain a 50 per cent overlap of the tape during the wrapping.
- (c) Without a break in the tape wrap in the reverse direction until the first wrap is completely covered, maintaining the 50 per cent overlap, and finish neatly at the starting point.
- (d) Secure the tape using lacing braid with a clove hitch and reef knot; seal the knot with Silicone varnish.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

B. Salvage B.493642M.

NOTE: This salvage is implemented on single or multicore fireproof screened and jacketed cables, where both the outer jacket and screened sleeves are damaged, but the screen function is not seriously impaired, i.e., not more than 50 per cent of the braid strands being broken; refer to Figure 414 for the repair layout and Table 404 for suitable materials. If more extensive damage has been sustained the cable must be replaced.

(1) Procedure.

- (a) Smooth out and re-lay the damaged screen braid to cover the maximum area of exposed cable; curl the frayed ends away from the cable to avoid their penetration of the core insulation.
- (b) Commencing at a point approximately 0.500 in. (12,70 mm) from the damaged area, wrap the cable with glass cloth tape, using a 50 per cent overlap of the cloth and continue to a point 0.500 in. (12,70 mm) beyond the damaged area.
- (c) Using PTFE tape and commencing at a point approximately 1.000 in. (25,40 mm) from the glass cloth tape, firmly wrap the one inch area of insulation and the glass cloth tape, then continue the wrap to a point 1.000 in. (25,40 mm) over the insulation, beyond the other end of the glass cloth tape. Maintain a 50 per cent overlap of the tape during this operation.
- (d) Without a break in the tape wrap in the reverse direction until the first wrap is completely covered, maintaining the 50 per cent overlap, and finish neatly at the starting point.
- (e) Secure the tape using lacing braid with a clove hitch and reef knot; seal the knot with Silicone varnish.

7. Repair Single Fireproof Cable Jacketed

A. Salvage B.493642N.

NOTE: This salvage is implemented on single fireproof jacketed cables, where the damage is confined to the outer jacket; refer to Figure 415 for the repair layout and Table 405 for suitable materials.

(1) Procedure.

- (a) Remove all debris from the damaged area, then ensure that the damage is limited only to the outer jacket.
- (b) Using the appropriate PTFE tape, and commencing 1.500 in. (38,1 mm) to one side of the damaged area, firmly wrap the 1.500 in. (38,1 mm) area of insulation, the damaged section, and the insulation 1.500 in. (38,1 mm) beyond the other side of the damage. Maintain a 50 per cent overlap of the tape during the wrapping.
- (c) Without a break in the tape wrap in the reverse direction until the first wrap is completely covered maintaining the 50 per cent tape overlap, and finish neatly at the starting point.
- (d) Secure the tape using lacing braid with a clove hitch and reef knot; seal the knot with Silicone varnish.

OVERHAUL

- (1) Set the heat gun to produce a minimum temperature of 380 deg C; a five minute warm-up period of the gun, prior to heat application at the sleeve is recommended.
- (2) With the sleeve correctly positioned on the cable, direct the hot air onto the sleeve, until the PTFE becomes transparent and the sleeve has shrunk to a snug fit. Ensure that the hot air is applied to the entire circumference and length of the sleeve.
- (3) As soon as the sleeve has become transparent and has shrunk into position, cease the application of hot air. Shrinkage normally occurs within 8-20 seconds but should not exceed 50 seconds.
- (4) Inspect the finished shrink sleeve for condition. Ensure that the surface is smooth and free from splitting, and that the surrounding area of the cable is free from heat damage.

**B. Instructions for Soldering Screen Braid.**

**WARNING:** **HEALTH HAZARD.** MATERIALS USED IN THESE REPAIRS ARE COMPOSED OF POLYTETRAFLUOROETHYLENE (PTFE). THIS MATERIAL WILL EMIT TOXIC GASES WHEN SUBJECTED TO TEMPERATURES ABOVE 340 DEG C. THE HIGHER THE TEMPERATURE THE GREATER THE EMISSION OF TOXIC GAS. ADEQUATE VENTILATION IS TO BE PROVIDED WITHIN THE WORK AREA AND CLOSE TO THE HEATING SOURCE.

- (1) Paint the cable braid area to be soldered with an approved flux (Kester 1544).
- (2) Locate the solder sleeves over the braid ends, ensure that the solder rings are centrally located over the 0.25 in. (6,25 mm) cable end areas.
- (3) Allow a suitable Thermo-gun, such as the Raychem type CV1511-110 with a PR13C reflector, set at position 4, to warm-up for a five minute period at a power of 1100 watts.

REPAIR

OVERHAUL

- (4) At the end of the five minute period the temperature must be between 500 and 600 deg C. Apply heat to the solder sleeves; ensure that the heat is evenly distributed around the sleeve periphery,. A heat soak time of 25 to 35 seconds, will ensure a good solder flow.
- (5) Check that the solder has run satisfactorily around the cable periphery, slight trace of solder should be visible around the edge of the solder sleeves and ensure that the cable adjacent to the joint shows no visible signs of heat damage.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (g) With the blade release handle depressed, insert the unstripped end of the sample cable length, through the bush to butt against the previously adjusted stop. When the adjustable cable stop has been removed, insert the cable to the required measured length.
- (h) Free the blade release handle, then apply outward pressure to the release handle, to ensure that the end of the blade release remains in contact with the cam screw.
- (j) Holding the cable rigid rotate the tool in excess of one revolution.
- (k) Raise the blade and remove the sample length of cable from the tool.
- (l) Separate the insulation at the cut by gently bending the cable. Remove the end insulation thereby exposing the conductor.

NOTE: Do not use the cutting blade to remove the insulation end.

- (m) Examine the conductor strands for any damage caused by the blade; if necessary readjust the cam screw.
- (n) When satisfactory removal of the insulation from the sample cable has been achieved and the condition of the cable conductor is acceptable, retain the tool settings and strip the engine cable requiring repair.

#### B. Heat Shrinkage Instruction.

WARNING: BEFORE USING THE HEAT SHRINKING PROCEDURE ENSURE THAT ALL SAFETY PRECAUTIONS REGARDING VENTILATION OF THE WORK AREA ARE COMPLIED WITH, AND THAT A SUITABLE RAYCHEM THERMO-GUN TYPE CV.1509-110 OR CV.1511-110 WITH A PR24 OR PR13C REFLECTOR IS USED. ENGINE ELECTRICAL CABLES - ASSEMBLY

1. General

- A. Before commencing this assembly refer to Standard Practices 71-09-00, Assembly for general information.
- B. Refer to 71-00-02 Engine Electrical Harness, for the description of the electrical cable and harness assemblies.
- C. Throughout the text, special tools are quoted by their reference number; e.g. Tool 1234. For a complete list of tooling required for assembly and for the Manufacturer's Part Number, refer to Special Tools, Fixtures and Equipment, Table 1002.
- D. During the assembly procedure reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title e.g. connectors, pins, seals, etc. When the item is a part of the breakdown of the text concerned, the item will be identified e.g. seal (12-40), the 12 referring to the I.P.C. Fig.No., and the 40 referring to the Item No.
- E. The extent of assembly required at overhaul on serviceable harnesses is limited to binding the seven harnesses into one electrical cable assembly (Ref.para.10), but to enable the replacement of defective items or complete harnesses to be made, following rejection by Inspection/Check or Test, the extent of assembly in this text covers the complete assembly of each harness.
- F. The text follows the sequence that the assembly will be carried out, i.e. preparation of cable terminals, assembly of plugs, assembly of harness etc., but each part is dependent on each other and must be carried out in unison.
- G. During assembly treat the cables and plugs of the electrical cable assembly as fragile, and ensure that plug pins are protected from damage by assembling the correct blanking covers, and that harnesses and cable assemblies are stowed in containers.

## 2. Cable Terminal Preparation

### A. General.

The following procedure details the assembling of various terminals to the ends of cables. These procedures are to be used in conjunction with the assembly of the seven harnesses (Ref. para. 4 to 9), which detail the various types of cables, contacts, sealing plugs etc. that are to be used and the positions at which they are to be attached. The assembling of the various plugs to the cables are detailed in para. 3.

### B. Assemble Shrink Sleeves and Shrink/Solder Sleeves to Cables.

WARNING: SHRINK SLEEVES ARE COMPOSED OF POLYTETRAFLUOROETHYLENE (PTFE) WHICH WILL EMIT TOXIC GAS WHEN SUBJECTED TO TEMPERATURES ABOVE 340 DEG C. GAS EMISSION INCREASES WITH TEMPERATURE INCREASE. ADEQUATE VENTILATION MUST BE PROVIDED AS CLOSE TO HEATING SOURCE AS POSSIBLE.

- (1) Assemble the (Thermofit) shrink sleeves to the cables.
  - (a) Establish the bore size and length of the shrink sleeve required (Ref. Table 501).
  - (b) Assemble the shrink sleeve over the cores or screen termination as required (Ref. Fig. 501 Detail D).
  - (c) Attach the reflector (Tool 2605) to the Thermo-gun (Tool 2603) and set the control on the Thermo-gun to between 380 and 410 deg.C.
  - (d) Allow the Thermo-gun to heat up to the required temperature, then direct the hot air over all the surface of the sleeve for 8 to 20 seconds until it has become transparent and shrunk to a snug fit. Do not apply heat in excess of 50 seconds.

Thermofit Shrink Sleeving Sizes  
Table 501

- (e) Stop the application of hot air when the sleeve has shrunk and allow the sleeve to cool. Turn off the Thermo-gun. Ensure that the sleeve is not split and that no heat damage has occurred.
- (2) Assemble the shrink/solder sleeves to the cables.

NOTE: The shrink/solder sleeve consists of a pre-fluxed solder ring situated centrally in a sleeve composed of Polytetrafluorethylene. Observe the warning given at the commencement of this paragraph.

- (a) Establish the correct size of shrink/solder sleeve required (Ref. Table 502).
- (b) Apply multicore flux 'B' to the bore of the solder sleeve.

NOTE: Ensure that the earthing braid and earthing tail conductor have had multicore flux 'B' applied.

- (c) Assemble the sleeve in the correct position over the screen braid and earthing tail (Ref.Fig.502 Detail E).

## C. Assemble Contacts to Cable Cores (Ref.Fig.501).

**NOTE :** There are two types of contacts used with the electrical plugs, pin contacts and socket contacts. Both types use the same tools and are similarly assembled to the cores.

- (1) Strip the insulation from the ends of the cores to be crimped using Ideal Stripmaster. The length to be stripped is dependent on the cable size (Ref.Table 503) and (Detail E).
- (2) Insert a cable core into the rear of a contact so that the insulation abuts against the rear of the contact.
- (3) Ensure that the core is visible through the inspection hole of the contact (Detail E).
- (4) Using the crimping tool (Tool 2703) and the correct contact locator (Tool 2704), insert the contact into the tool ensuring that the shoulder of the contact abuts the crimping tool (Detail F), then crimp the contact.
- (5) Assemble contact(s) to the remaining core(s) as detailed in para.(2) to (4).

CABLE SIZE (AWG)	LENGTH OF INSULATION TO BE REMOVED
16	0.480 to 0.530 in. (12,1920 to 13,4620 mm)
18	0.240 to 0.280 in. (6,0960 to 7,1120 mm)
20	0.240 to 0.280 in. (6,0960 to 7,1120 mm)
22	0.240 to 0.280 in. (6,0960 to 7,1120 mm)
24	0.240 to 0.280 in. (6,0960 to 7,1120 mm)

OVERHAUL

D. Termination of Low Noise Cables (Ref.Fig.501).

- (1) Remove sufficient of the outer covering, screen braid and fillers to allow individual cores to be prepared for the installation of the connectors (Detail A).
- (2) Strip the outer covering for a further 0.500 in. (12,700 mm). Comb out the screen and lay it back along the outer covering. Trim the screen as required (Detail B).
- (3) Slide the shrink sleeves onto the individual cores so that they abut the screen (Detail C) and shrink into position as detailed in para.2.B.
- (4) Assemble a shrink sleeve 1.000 in. (24,40 mm) in length over the exposed braid so that the sleeve is positioned centrally (Detail D), then shrink into position as detailed in para.2.B.
- (5) Strip the shrink sleeve and Kapton insulation from the cores to the correct length (Ref.Table 503) and (Detail E) using the Ideal Stripmaster.
- (6) Assemble contacts to the bared cores of the cables (Ref.para.2.C.).

E. Termination of Screen Braid with No Earth Requirement (Ref.Fig.502).

- (1) Remove from the cable sufficient of the outer covering, screen braid and fillers to allow individual cores to be prepared for the installation of the connectors (Ref.Table 503) and (Detail A), and the turn back of the screen braid (Detail B).
- (2) Lay the screen braid back along the outer covering for not less than 0.250 in. (6,350 mm) (Detail B). Terminations may be staggered to avoid bunching and trimmed as required.

- (3) Assemble a shrink sleeve 1.000 in. (24,40 mm) in length over the exposed braid so that the sleeve is positioned centrally (Detail C), then shrink into position as detailed in para.2.B.
- (4) Assemble contacts to the bared cores of the cables (Ref.para.2.C.).

F. Attachment of Staggered Earthing Tail Using High Temperature Solder Sleeve (Ref.Fig.502)..

- (1) Assemble the (earthing tail) shrink/solder sleeve to the cable and ensure that it is fed onto the cable sufficiently to allow the screen braid to be exposed (Detail D).
- (2) Remove from the cable sufficient of the outer covering, screen braid and fillers to allow individual cores to be prepared for the installation of the connectors (Ref.Table 503) and (Detail A), and the turn back of the screen braid (Detail B).
- (3) Lay the screen braid back along the outer covering for not less than 0.250 in. (6,350 mm). Terminations may be staggered to avoid bunching and trimmed as required (Detail B).
- (4) Assemble a shrink sleeve 1.000 in. (24,20 mm) in length over the exposed braid so that the sleeve is positioned centrally (Detail C), then shrink into position as detailed in para.2.B.
- (5) At a minimum distance of 0.750 in. (19,050 mm) from the sleeve, remove the outer covering to expose the screen braid for a length of between 0.500 and 0.312 in. (12,70 and 7,925 mm) (Detail D).
- (6) Strip the insulation from the earthing tail for a distance of (approx.) 0.300 in. (7,620 mm), then coat the bared conductor with multicore flux 'B'.

- (7) Slide the previously assembled shrink/solder sleeve into position with the solder sleeve centrally over the exposed braid (Detail E).
- (8) Insert the bared conductor of the earthing tail between the solder sleeve and the exposed braid (Detail E).
- (9) Shrink the shrink/solder sleeve onto the cable (Ref.para.2.B.).
- (10) Assemble the contacts to the bared cores of the cables (Ref.para.2.C.).

G. Attachment of Non-staggered Earthing Tail Using High Temperature Solder Sleeve (Ref.Fig.503).

- (1) Remove from the cable sufficient of the outer covering, screen braid and fillers to allow individual cores to be prepared for the installation of the connectors (Ref.Table 503) and (Detail A).
- (2) Further strip the outer covering to expose between 0.312 and 0.500 in. (7,92 and 12,70 mm) of screen braid (Detail A), then coat the braid with multicore flux 'B'.
- (3) Strip the insulation from the earthing tail for a distance of (approx.) 0.300 in. (7,62 mm) (Detail B), then coat the bared conductor with multicore flux 'B'.
- (4) Slide the shrink/solder sleeve over the cable and position the solder sleeve centrally over the exposed braid (Detail C).
- (5) Insert the bared conductor of the earthing tail between the solder sleeve and the exposed braid.
- (6) Shrink the shrink/solder sleeve onto the cable (Ref.para.2.B.).
- (7) Assemble contacts to the bared cores of the cables (Ref.para.2.C.).

### 3. Assemble Plugs to Cable

#### A. General.

The following procedure details the assembling of various types of plugs to cables and the assembling of telescopic bushes or wrapping. These procedures are to be used in conjunction with the assembly of the seven harnesses (Ref. para.4 to 9), which detail the cables, plugs, bushes etc. that are to be used and the positions at which they are to be attached. The preparation of the various cable terminals are detailed in para.2.

NOTE: When SB.71-15 and 71-8455-23 are embodied, the plug type will be identified by the manufacturers code prefix HTMAS for Cannon and 992 for Deutsch. Pre SB.71-15 and 71-8455-23 plugs are identified by the code prefix HTMA.

#### B. Assemble Telescopic Bushes to Cables (Fig.504).

NOTE: Glasscloth tape must be assembled to all plug positions that do not have telescopic bushes assembled. The procedure for assembling the tape is detailed at the appropriate part of the plug assembly.

(1) Assemble the telescopic bushes to the cables at the following positions (Detail A).

- (a) On engines to Pre SB.71-15, 71-8455-23 and 71-9056-33 standard, assemble telescopic bushes to all plug positions other than disconnect points B, C, D, E, F, G and H.
- (b) On engines to SB.71-15 and 71-8455-23 standard, assemble telescopic bushes to all positions other than disconnect points B, C, D, E, F, G and H and plug positions B1/H4, C1, C2 and G8.
- (c) On engines to SB.71-9056-33 standard, assemble telescopic bushes to all positions other than disconnect points B, C, D, E, F, G and H and plug position H3 (where a support bush is used).

ASSEMBLY

C. Connect Plugs to Cables (Fig.504).

- (1) Remove from the appropriate plug the plug end bell from the plug body and release the clamp bars (Detail B). Assemble the plug end bell on to the cables (Detail C).
- (2) Identify the cable contacts and the positions they are to be inserted into in the plug body.
- (3) Place a contact into the insert tool (Tool 2701), then insert the contact into the correct hole in the rear of the plug body. Press the insert tool against the contact shoulder using firm even pressure (Detail C). The contact should be correctly locked in position when a slight click is heard, indicating that the contact has bottomed and the retaining tines have locked into place behind the contact shoulder.

NOTE: Some insert tools are dual purpose, inserter/extractor, ensure the correct end of the tool is used.

- (4) Remove the insert tool from the plug body and check that the contact is correctly locked by giving the cable a gentle pull.
- (5) Insert the remainder of the contacts into the correct positions in the plug body.
- (6) Fill any unoccupied holes in the plug with sealing plugs as detailed in the appropriate table.
- (7) If the plug being connected is at positions G8, C1 or C2, assemble the spacers to the harness with the cables laying along the outside groove of the spacers (Detail D).
- (8) Screw the plug end bell onto the plug body and hand-tighten.

**D. Secure Plugs to Cables Containing Telescopic Bushes and Support Bush (SB.71-9056-33) (Fig.504).**

- (1) Ensure that all telescopic bushes and cable spacers (at positions G8, C1 or C2) are correctly positioned under the clamp bars (Detail D).

**CAUTION: CABLES MUST NOT BE IN TENSION WHEN ASSEMBLING CLAMPS.**

- (2) On engines to Pre SB.71-15 and 71-8455-23 standard, at positions other than disconnect points B to H, tighten evenly the two clamp bar screws with screwdriver (Tool 2606) until no gap is visible between clamp bars (Detail D). Using pliers (Tool 2607) wire-lock the plug assembly and clamp screws. Use lockwire B.
- (3) On engines to SB.71-15 and 71-8455-23 standard, at plug positions B2/H5, D1.5.11, F5 and F6, tighten evenly the two clamp bar screws with screwdriver (Tool 2606) to achieve firm clamping of the cable, whilst maintaining an even gap between the clamp bars, which must not exceed 0.100 in. (2,540 mm) (Detail E). Ensure that the telescopic bush is not distorted and trapped between the clamping ends of the bars. Using pliers (Tool 2607), wire-lock the plug assembly and clamp screws. Use lockwire B.
- (4) On engines to SB.71-15 and 71-8455-23 standard, at positions C3, C4, C5, C6, C7, C8, D2, D7, D9, D10, E1.2.3, E5, E8, E9, E11, F1, F2, G1, G4, G6, G9, G10, H1 and H3 tighten the clamp screws with screwdriver (Tool 2606) until no gap is visible between clamp bars. Using pliers (Tool 2607), wire-lock the plug assembly and clamp screws. Use lockwire B.

**E. Secure Plugs to Cables Containing Glasscloth Tape.**

- (1) Wrap glasscloth tape of at least 2 layers thickness around the cables at the clamp positions. The tape must be applied over approximately 1.000 in. (25,400 mm) length of cable and must be of sufficient thickness to conform with the following clamping requirements.

**NOTE :** Glasscloth tape 'A' has a backing strip which must be removed.

ASSEMBLY

**71-51-01**

OVERHAUL

- (2) On engines to Pre SB.71-15 and 71-8455-23 standard at disconnect points B to H, wrap glasscloth tape 'A', 'B' or 'C' around the cables to achieve the following result.
  - (a) Place the half clamps over the wrapped section of the cable. Assemble the clamp bars over the half clamps, then apply hand pressure to the clamp bars and ensure that a gap between 0.060 in. and 0.100 in. (1,524 and 2,540 mm) exists between the clamp bars (Detail F).
  - (b) Using screwdriver (Tool 2606), tighten the two clamp bar screws until no gap exists between the clamp bars.
  - (c) Using pliers (Tool 2607), wire-lock the plug assembly and clamp screws. Use lockwire B.
- (3) On engines to SB.71-15 and 71-8455-23 standard at disconnect points B to H and plug positions B1/H4, C1, C2 and G8 wrap glasscloth tape 'A' around the cables to achieve the following result.
  - (a) At disconnect points B to H place the half bushing sleeves over the wrapped section of the cable, then apply hand pressure to the half bushing sleeves and ensure that the cable assembly is firmly clamped. Assemble the clamp bars over the half bushing sleeves and using screwdriver (Tool 2606), tighten the two clamp bar screws until the half bushing sleeves are held together without a gap (Detail G).

NOTE: The resultant gap between the clamp bars is not governed dimensionally after tightening.

  - (b) At plug positions B1/H4, C1, C2 and G8 place the clamp bars over the wrapped section of the cable. Using screwdriver (Tool 2606), tighten the two clamp bar screws to achieve firm clamping of the cable, whilst maintaining an even gap between the clamp bars which must not exceed 0.100 in. (2,540 mm)

OVERHAUL

- (c) Using pliers (Tool 2607), wire-lock the plug assembly and clamp screws. Use lockwire B.

#### 4. Assemble B and H Harness

##### A. General.

The following procedure is not required if the existing harness is serviceable. This text details the assembling of a new harness, or the replacement of cables or plugs in the event that defects found during Inspection/Check or Test, cannot be rectified by the procedures detailed in Repair No.1 of 71-51-01. When defective plugs are to be replaced, refer to 71-51-01 Disassembly for the removal of the plugs.

NOTE: The B and H harnesses are combined into one assembly.

##### B. Preparation for New Assembly or Rectification.

- (1) Determine the SB./Mod. standard required, then refer to the loom template (Tool 2711). The template will detail the positioning of the cables, lacings, plugs and wrappings.
- (2) Determine the various types of cables required by reference to Fig.505 and Table 504, and for the lengths of cable, refer to Table 511 and the loom template.
- (3) Determine the various types and sizes of plugs, bushes, contacts and sealing plugs by reference to Table 505 and the I.P.C., and for shrink/solder sleeves (if required) refer to Table 502.

NOTE: Having obtained the required items noted in para.B. proceed with the assembly or rectification of the harness.

##### C. Assemble a New Harness.

- (1) Position the new cables on the loom template, then measure off the correct lengths and cut as required.
- (2) Prepare the ends of the cables and attach the earthing tails (as required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).

ASSEMBLY

71-51-01

Page 517

MK.610-14-28  
OVERHAUL

- (3) Assemble the correct plugs to the cables (Ref. para.E. and para.3.).
- (4) Assemble the lacings and clamp markings as detailed on the template.
- (5) Check that the harness is serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (6) Place the harness in its storage container (LG.11199) and assemble protectors to the plugs.

D. Replace a Defective Cable.

- (1) Remove the defective harness from its storage container and position it on the loom template as indicated.
- (2) Measure off the correct length of the required cable against the template.
- (3) Prepare the ends of the cable and attach an earthing tail (if required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).
- (4) Assemble the correct plugs to the cable (Ref. para.E. and para.3.).
- (5) Release and remove the defective cable (or cables) from the harness, then assemble the new cable(s) to the harness and replace the required lacings and clamp markings as detailed on the template.
- (6) Check that the harness is now serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (7) Replace the harness in its storage container (LG.11199) and assemble protectors to the plugs.

E. Assemble Plugs to Cables.

CAUTION: CANNON SEALING RINGS MUST ONLY BE ASSEMBLED TO CANNON PLUGS AND DEUTSCH SEALING RINGS ASSEMBLED TO DEUTSCH PLUGS.

NOTE: Throughout the text refer to wiring diagram (Ref.Fig.505), plug assemblies (Ref.Fig.507) and the assembly of plugs to cables (Ref. para.3.).

(c) Insert a new sealing ring (12-40) into the plug.

## 5. Assemble C Harness

### A. General.

The following procedure is not required if the existing harness is serviceable. This text details the assembling of a new harness, or the replacement of cables or plugs in the event that defects found during Inspection/Check or Test, cannot be rectified by the procedures detailed in Repair No.1 of 71-51-01. When defective plugs are to be replaced, refer to 71-51-01 Disassembly for the removal of the plugs.

### B. Preparation for New Assembly or Rectification.

- (1) Determine the SB./Mod. standard required, then refer to the loom template (Tool 2711). The template will detail the positioning of the cables, lacings, plugs and wrappings.

- (2) Determine the various types of cables required by reference to Fig.508 and Table 504, and for the lengths of cable, refer to Table 511 and the loom template.
- (3) Determine the various types and sizes of plugs, bushes, contacts and sealing plugs by reference to Table 506 and the I.P.C., and for shrink/solder sleeves (if required) refer to Table 502.

NOTE: Having obtained the required items noted in para.B. proceed with the assembly or rectification of the harness.

C. Assemble a New Harness.

- (1) Position the new cables on the loom template, then measure off the correct lengths and cut as required.
- (2) Prepare the ends of the cables and attach the earthing tails (as required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).
- (3) Assemble the correct plugs to the cables (Ref. para.E. and para.3).
- (4) Assemble the lacings and clamp markings as detailed on the template.
- (5) Check that the harness is serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (6) Place the harness in its storage container (LG.11199) and assemble protectors to the plugs.

D. Replace a Defective Cable.

- (1) Remove the defective harness from its storage container and position it on the loom template as indicated.
- (2) Measure off the correct length of the required cable against the template.

- (2) Prepare the ends of the cables and attach the earthing tails (as required), then assemble the correct pin or socket contacts to the cable cores (Ref.para.2).
- (3) Assemble the correct plugs to the cables (Ref.para.E. and para.3.).
- (4) Assemble the lacings and clamp markings as detailed on the template.
- (5) Check that the harness is serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (6) Place the harness in its storage container (LG.11199) and assemble protectors to the plugs.

D. Replace a Defective Cable.

- (1) Remove the defective harness from its storage container and position it on the loom template as indicated.
- (2) Measure off the correct length of the required cable against the template.
- (3) Prepare the ends of the cable and attach an earthing tail (if required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).
- (4) Assemble the correct plugs to the cable (Ref.para.E. and para.3.).
- (5) Release and remove the defective cable (or cables) from the harness, then assemble the new cable(s) to the harness and replace the required lacings and clamp markings as detailed on the template.
- (6) Check that the harness is now serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (7) Replace the harness in its storage container (LG.11199) and assemble protectors to the plugs.

E. Assemble Plugs to Cables.

**CAUTION:** CANNON SEALING RINGS MUST ONLY BE ASSEMBLED TO CANNON PLUGS AND DEUTSCH SEALING RINGS ASSEMBLED TO DEUTSCH PLUGS.

**NOTE:** Throughout the text refer to wiring diagram (Ref.Fig.512), plug assemblies (Ref.Fig.513) and the assembly of plugs to cables (Ref. para.3.).

(1) Assemble plug E to cables.

(a) Assemble, connect and secure the plug to the cables, ensuring that sealing plugs are assembled to unused plug holes and tape is assembled under the clamp location (Ref.para.3.C. and E.).

(b) Insert a new sealing ring (15-230) into the plug.

(2) Assemble plug E1/E2/E3 to cables.

(a) Assemble the three telescopic bushes to the cables.

(b) Assemble, connect and secure the plug to the cables (Ref.para.3.C. and D.).

(c) Insert a new sealing ring (15-150) into the plug.

(3) Assemble plug E5 to cables.

**NOTE:** Assemble plug E11 in the same manner.

(a) Assemble the two telescopic bushes to the cables.

(b) Assemble, connect and secure the plug to the cables, ensuring that a sealing plug is assembled to the unused plug hole (Ref.para.3.C. and D.).

(c) Insert a new sealing ring (15-70) into the plug.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (4) Terminate end of cable at plug position E16 (SB.71-7 and Pre SB.71-11).

NOTE: When SB.71-7 is embodied the E16 plug is not required and when SB.71-11 is embodied the cables will have been removed.

- (a) Assemble a plain sleeve (15-330) to each of the three contacts (Ref. para. 2.B.).

- (5) Assemble plug E8 to cables.

NOTE: Assemble plug E9 in the same manner.

- (a) Assemble the two telescopic bushes to the cables.

- (b) Assemble, connect and secure the plug to the cables (Ref. para. 3.C. and D.).

- (c) Insert a new sealing ring (15-30) into the plug.

- (6) Wall mounting receptacle.

The wall mounting receptacle is no longer required, and the cable is tied back. Refer to SB 77-8876-32 for details.

## 8. Assemble F Harness

### A. General.

The following procedure is not required if the existing harness is serviceable. This text details the assembling of a new harness, or the replacement of cables or plugs in the event that defects found during Inspection/Check or Test, cannot be rectified by the procedures detailed in Repair No.1 of 71-51-01. When defective plugs are to be replaced, refer to 71-51-01 Disassembly for the removal of the plugs.

### B. Preparation for New Assembly or Rectification.

- (1) Determine the SB./Mod. standard required, then refer to Table 512 for the loom template required. The template will detail the positioning of the cables, lacings, plugs and wrappings.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (2) Determine the various types of cables required by reference to Fig.514 and Table 504, and for the lengths of cable, refer to Table 511 and the loom template.
- (3) Determine the various types and sizes of plugs, bushes, contacts and sealing plugs by reference to Table 509 and the I.P.C., and for shrink/solder sleeves (if required) refer to Table 502.

NOTE: Having obtained the required items noted in para.B. proceed with the assembly or rectification of the harness.

C. Assemble a New Harness.

- (1) Position the new cables on the loom template, then measure off the correct lengths and cut as required.
- (2) Prepare the ends of the cables and attach the earthing tails (as required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).
- (3) Assemble the correct plugs to the cables (Ref. para.E. and para.3).
- (4) Assemble the lacings and clamp markings as detailed on the template.
- (5) Check that the harness is serviceable (Ref. 71-00-02 Testing). Rectify any defects and re-test until serviceable.
- (6) Place the harness in its storage container (LG.11199) and assemble protectors to the plugs.

D. Replace a Defective Cable.

- (1) Remove the defective harness from its storage container and position it on the loom template as indicated.
- (2) Measure off the correct length of the required cable against the template.
- (3) Prepare the ends of the cable and attach an earthing tail (if required), then assemble the correct pin or socket contacts to the cable cores (Ref. para.2).

- (3) Assemble plug G8 to cables.
  - (a) Assemble the telescopic bush to the cables (Pre SB.71-8455-23).
  - (b) Assemble and connect the plug to the cables, ensuring that sealing plugs are assembled to unused plug holes.
  - (c) On plug to Pre SB.71-8455-23 secure the plug (Ref.para.3.C. and D.), or on plug to SB.71-8455-23, assemble tape to the cable under the clamp location and secure the plug (Ref.para.3.C. and E.).
  - (d) Insert a new sealing ring (17-160) into the plug.
- (4) Assemble plug G10 to cables.
  - (a) Assemble two telescopic bushes to the cables.
  - (b) Assemble, connect and secure the plug to the cables, ensuring that a sealing plug is assembled to the unused plug hole (Ref.para.3.C. and D.).
  - (c) Insert a new sealing ring (17-120) into the plug.

## 10. Assembly of Complete Electrical Cables

### A. General.

The complete assembly of electrical cables comprises seven multi-cable harnesses. Loom template (Tool 2711) is required to provide the correct positioning of the harnesses, wrappings and the unique point.

### B. Preparation for Assembly.

- (1) Remove the harnesses from their respective storage containers and lay out in their respective positions on the loom template.

ASSEMBLY

71-51-01

Page 560

Jun 1/99

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (2) Secure the bottom block (10-90) of the unique block to the loom template (Tool 2711) with two bolts (10-80). Torque-tighten the bolts between 85 and 95 lbf in. (9,6 to 10,7 N.m).
- (3) Assemble the harnesses H, F, D and C to the bottom block in the positions indicated (Ref.Fig.518).
- (4) Hold the harnesses in position, then assemble the middle block (10-70) and retain with two special bolts (10-60). Tighten the bolts using the flats on the bolts provided, until the middle and bottom block touch, then release pressure until the flats on the bolts line up with the flats in the block.

CAUTION: ALIGNMENT OF FLATS ON SPECIAL BOLTS AND BLOCK MUST NOT BE ACCOMPLISHED BY TIGHTENING AFTER BLOCKS TOUCH EACH OTHER.

- (5) Before assembling the remaining harnesses to the engine block, ensure that the harnesses already connected are laid out correctly and that the harness break-offs correspond with the template, without creating a twist within the harness.
- (6) Assemble the harnesses G, E and B to the middle block in the positions indicated (Ref.Fig.518).
- (7) Hold the harnesses in position, then assemble the top block (10-50) over the harnesses and secure with two nuts (10-40). Torque-tighten the nuts between 85 and 95 lbf in. (9,6 to 10,7 N.m).
- (8) Establish that the unique point is in the correct position and that the harness lengths from the unique point centre line to the rear faces of the plugs are correct (Ref.Table 511).

ASSEMBLY

Table 511

### C. Binding Harnesses.

- (1) Bind the branch harnesses with Rapidon tape 'A' (Ref. Fig.519 and 520).
  - (a) Bind the branch harness with Rapidon tape starting at the grid positions 26F and 25T and ensure that no twist occurs (Ref. Fig.519).
  - (b) Where the branch harness terminates at the main branch, a sufficient length of Rapidon must be left so that it can be interlaced into the main branch Rapidon.
  - (c) Bind the main branch with Rapidon tape starting at grid position 40K, position 1.
  - (d) Leave a sufficient length of Rapidon tape so that it can be interlaced for a length of (approx) 2.000 in. (50,8 mm) with the branch from 40K, position 2.
  - (e) Bind the main branch with Rapidon tape starting at grid position 40K, position 2, and continue along the main branch to the unique point, interlacing the previously installed branch loom Rapidon tapes.

**NOTE:** When the complete cable assembly is assembled to the engine, the Rapidon tape ends are to be secured within the respective cable clamps.

D. Final Dressing.

- (1) Secure looms prior to clamping during the engine dressing stage with sealing tape.
- (2) Use glasscloth tape as packing under clamps where adverse tolerances may cause a loose fitting.
- (3) Assemble clamps on to the cables in accordance with the template.
- (4) Ensure that all lacings and binding have been carried out correctly.
- (5) Ensure that coloured braid markings are in the correct positions in accordance with the template.
- (6) Ensure that tape markers are correct and attached securely to the cables.
- (7) Ensure that all protective caps are secure on the plugs.
- (8) Carefully place the complete harness into a clean container for transportation or storage.
- (9) Ensure that all documents have been duly signed.

ENGINE ELECTRICAL CABLES - SPECIAL TOOLS,  
FIXTURES AND EQUIPMENT

1. General

- A. The special tools, fixtures and equipment listed in Table 1001 and 1002 are those required to disassemble and assemble the engine electrical harness looms.
- B. The tools have been listed in order of usage and the Tool Ref. No. is the number quoted in the text. Tools marked with an \* are used in more than one aspect of overhaul, and will be duplicated in the tables. Tools used other than those supplied by Rolls-Royce (1971) Limited are indicated by the component manufacturer and part number.
- C. The tools are illustrated in order of usage, but tools used in more than one aspect of overhaul will only be illustrated once. Additional illustrations of tooling in operation are included in the text for clarification of usage.

## ENGINE DRAINS - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

OVERHAUL

- (b) Bolt holes elongated  
less than 0.030 in.  
(0,760 mm).

Accept after  
repair.

- (2) Nicks, burrs and fretting.

Accept after repair  
providing attach-  
ment face thickness  
is not reduced  
by more than 5 per  
cent.

5. Drains Tank (302-90)

A. Inspect Tank Shell.

- (1) Punctures.

Reject.

- (2) Dents.

- (a) Small dents with smooth  
contours and no impact  
marks.

Accept.

- (3) Scores, nicks and burrs.

Accept after repair  
provided wall thick-  
ness is not re-  
duced more than  
one third.

B. Inspect Overflow Vent Body Abutment Face.

- (1) Nicks and burrs.

Accept, if repair  
will preserve  
sealing capability.

- (2) Scores.

- (a) Running into fluid passages.

Reject.

- (b) Isolated, not more than  
0.005 in. (0,130 mm) deep.

Accept, if repair  
will preserve  
sealing capability.

- (3) Wear.

Accept, if sealing  
capability  
unimpaired.

C. Inspect Mounting Attachment Points.

(1) Wear and fretting.

- |     |  |                         |
|-----|--|-------------------------|
| (a) | Bolt holes elongated<br>less than 0.030 in.<br>(0,760 mm). | Accept after<br>repair. |
| (b) | Thickness not reduced by<br>more than 5 per cent.          | Accept after<br>repair. |

D. Inspect Union Adapters (Ref.72-09-00 Inspection/Check).

E. Inspect Metered Orifice in Passage to Overflow Vent Body.

NOTE: The metered orifice is 0.46 to 0.50 in. (10,16 to 12,70 mm) in diameter.

(1) Check for damage, using inspection mirror.

- |     |             |         |
|-----|-------------|---------|
| (a) | Any damage. | Reject. |
|-----|-------------|---------|

(2) Check for obstruction (Ref.71-70-00 Testing).

F. Check Tank for Leaks (Ref.71-70-00 Testing).

6. Drain Plug (302-100), Seal (302-110) and Plug (313-110)

A. Inspect Plugs (Ref.72-09-00 Inspection/Check).

B. Check Seal has been Renewed.

7. Mounting Bracket (302-140)

A. Inspect Abutment Faces.

- |     |  |   |
|-----|--|---|
| (1) | Nicks and burrs.   | Accept after repair<br>provided attachment<br>face is not reduced<br>by more than one<br>third. |
| (2) | Wear.  |   |
| (a) | Bolt holes elongated<br>not more than 0.030 in.<br>(0,760 mm). | Accept after<br>repair.   |
| (b) | Slight wear with 90 per<br>cent contact retained.              | Accept.   |

8. Bracket Assembly (302-150)

A. Inspect Mounting Bracket Abutment Face.

- (1) Nicks and burrs. Accept after repair.

B. Inspect Bolt Locations.

(1) Wear.

- (a) Bolt holes elongated less than 0.030 in. (0,760 mm). Accept after repair.

- (b) Thickness not reduced by more than 15 per cent. Accept after repair.

C. Inspect Captive Nut and Retainer (Ref.72-09-00 Inspection/Check).

9. Sealing Plates (303-30 and 313-100)

A. Inspect Sleeve Abutment Face and Bore.

- (1) Nicks, burrs and scores. Accept after repair.

B. Inspect Eccentric Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

10. Sleeves (303-40 and 313-90)

A. Inspect Abutment Faces.

- (1) Nicks, burrs and scores. Accept after repair.

B. Inspect Bolt Locations.

(1) Wear and fretting.

- (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

11. Overflow Vent Body (303-80) (SB.71-8)

A. Inspect Abutment Faces and Sleeve Location (Ref.Fig.304).

(1) Nicks, burrs and scores. Accept after repair  
providing sealing  
capabilities are /  
unimpaired.

(2) Wear.

(a) Sealing unimpaired. Accept.

B. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt holes elongated Accept after  
not more than 0.030 in. repair.  
(0,760 mm).

C. Inspect Valve Body Location.

(1) Wear.

(a) Light witness mark. Accept.

12. Helical Spring (303-110)

A. Check Spring Condition.

(1) (a) Check free length is Accept.  
1.080-1.040 in. (27,4-  
26,4 mm).

(b) Check "in position" length Accept.  
is 0.700 in. (17,8 mm) with  
applied load of 9.5-10.5 lbf  
(46,3-46,7 N).

B. Inspect End Coil Faces.

(1) Nicks and burrs. Accept if square-  
ness is retained  
after repair.

(2) Squareness.

(a) Not more than 5 deg error. Accept.

13. Valve Housing (303-115) (SB.71-8)

A. Inspect Sealing Valve Seat.

(1) Nicks, burrs and pitting. Reject.

B. Inspect Retaining Ring Location.

(1) Wear.

(a) Any stepped wear. Reject.

C. Inspect Outside Diameter.

(1) Wear.

(a) Not more than 0.010 in.  
(0,250 mm) in depth. Accept after repair.

(2) Nicks and burrs. Accept after repair.

D. Inspect Bore.

(1) Wear and fretting.

(a) Even, unstepped wear;  
light fretting. Accept after repair.

14. Filter (303-120)

A. Inspect Screen.

(1) Punctures, tears or separation  
from cage. Reject.

B. Inspect Cage.

(1) Cracks and distortion. Reject.

(2) Nicks, burrs and scores. Accept, if unbroken  
contact is retained  
after repair.

(3) Wear and fretting. Accept, if sealing  
capability is not  
impaired.

17. Tee Piece (307-230), Connector (308-350), Adapter (309-480)  
and Flanged Elbow (310-80)

A. Inspect Threaded Parts (Ref.72-09-00, Inspection/Check).

B. Inspect Attachment Flanges.

(1) Wear and fretting.

(a) Bolt holes elongated less than 0.030 in. (0,760 mm).	Accept after repair.
--	-------------------------

(b) Not more than 0.020 in. (0,510 mm) in depth.	Accept after repair.
---	-------------------------

C. Inspect Abutment Faces.

(1) Nicks, burrs and scores.

(a) Not more than 0.020 in. (0,508 mm) in depth.	Accept after repair if total reduction of thick- ness is not more than 15 per cent of mounting flange thickness.
---	--

18. Connectors (305-40/90/130, 306-160/200, 307-110, 308-150 and  
309-590), Fluid Passage Bolts (305-30/120, 306-150/190,  
307-100, 308-140 and 311-10) and Union Adapters (305-80/160  
and 308-170 and Adapter 309-580)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Abutment Faces.

(1) Nicks, burrs and scores.	Accept after repair if sealing capability is unimpaired.
------------------------------	---

(2) Wear and fretting.

(a) Even, unstepped, wear, sealing capability unimpaired.	Accept after repair.

04, Cleaning).

19. Tubes (308-300, 309-570, 310-50, 311-100, 312-80, 315-160 and 316-60/230/380)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Tubes (Ref.72-09-00 Inspection/Check, Rigid Tubes).

C. Inspect Connector Abutment Faces (311-100).

(1) Nicks, burrs and scores.

Accept after repair  
if sealing  
capability is not  
impaired.

(2) Wear and fretting.

(a) Even, unstepped, wear,  
sealing capability  
unimpaired.

Accept after  
repair.

D. Inspect Flange Abutment Faces (312-80 and 316-60).

(1) Nicks, burrs and scores.

(a) Not more than 0.010 in.  
(0,250 mm) in depth at  
abutment face of flange.

Accept after  
repair if sealing  
capability is not  
impaired.

20. Drain Body Upper and Lower (313-40/70)

A. Inspect Abutment Faces.

(1) Nicks, burrs, scores and wear.

Accept after repair  
if sealing capabil-  
ity is not impaired.

B. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Flange bolt holes elongated more than 0.030 in. (0,760 mm) or any elongation of other holes. Reject.

(b) Flange bolt holes worn not more than 0.030 in. (0,760 mm). Accept after repair.

C. Inspect Valve Seats (Ref.Fig.314).

(1) Nicks, burrs and pitting. Reject.

D. Inspect Valve Contact Faces in Bores (Ref.Fig.314).

(1) Nicks and burrs. Accept, if repair preserves sealing capability.

E. Inspect Washer Location (Ref.Fig.314).

(1) Nicks and burrs. Accept after repair.

21. Packing Piece (313-80)

A. Inspect Abutment Faces.

(1) Nicks, burrs and scores. Accept after repair.

22. Washers - 2 Off (313-120)

A. Inspect Contact Faces (Ref.Fig.314).

(1) Nicks and burrs. Accept after repair.

23. Springs - 2 off (313-130)

A. Check Spring Condition.

(1) (a) Check free length is 0.560-0.530 in. (14,2-12,5 mm). Accept.

- (b) Check "in position" length is 0.350 in. (8,9 mm) with applied load of  $7.60 \pm 0.60$  ozf ( $2,13 \pm 0,167$  N). Accept.

B. Inspect End Coil Faces.

- (1) Nicks and burrs. Accept if squareness is retained after repair.
- (2) Squareness.
- (a) More than 5 deg error. Reject.
- (b) Not more than 5 deg error. Accept.

24. Valves - 2 Off (313-140)

A. Inspect Sealing Surfaces (Ref.Fig.314).

- (1) Nicks, burrs and scores. Accept, if sealing is unimpaired after repair.

B. Inspect Spherical Surfaces (Ref.Fig.314).

- (1) Nicks, burrs and scores. Accept, if function is satisfactory after repair.

C. Inspect Spring Contact Face (Ref.Fig.314).

- (1) Nicks and burrs. Accept after repair.
- (2) Wear and fretting.
- (a) Even wear; light fretting. Accept after repair.

25. Flexible Tubes (305-10/20/60/70/110/150, 306-140/180, 307-10/90/200, 308-80/130 and 309-440)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

INSPECTION/CHECK

- B. Inspect Tube End Fittings (Ref.72-09-00 Inspection/Check).
- C. Carry Out Pressure Test (Ref.71-70-00 Testing).
- D. Inspect Wire Braid.

(1) Kinking.

- (a) Any kinking of strands. Reject.

(2) Damage.

- (a) Not more than two broken strands in any band along the entire length of the tube. Accept provided two adjacent bands are not affected.
- (b) Displaced strands. Accept subject to (1) (a).

(3) Distortion.

NOTE: Tubes may become permanently distorted by the previous installation, any such tubes which do not assume a reasonably straight position in the free condition must be rejected.

- (a) Any sharp bends. Reject.

(4) Dents.

- (a) Dents caused by clipping and only affecting outer braid. Accept.

ENGINE DRAINS - TESTING

1. General

- A. This testing must be carried out on completion of the work detailed in Engine Drains 71-70-00, Inspection/Check, or at any intermediate point as directed therein.
- B. It is assumed that the items making up components to be tested have been selected for compatibility and that any moving and fixed items have acceptable clearances, that mating surfaces have been correctly matched and any defective items have been repaired or replaced.
- C. Where a component forms part of a system, any later testing will be cross referenced to the Testing topic for the complete system when applicable. Testing to be carried out during assembly or installation is not cross referenced in this topic.
- D. To enable the items within this topic to be identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (IPC); thus, Fig.701-40 (701/40) in this text equates with the relevant Fig. and Item No. in the same topic in the IPC. Table 701 provides a cross reference to the equivalent IPC illustrations.
- E. Dimensional checks, when applicable, are cross referenced to the Fits and Clearances Schedule (FCS) at the relevant stage in the test procedure.
- F. Test equipment is listed in Table 702. Where specific equipment is not quoted, details of the purpose, range and accuracy of suitable equipment is provided, together with a test diagram.

## 2. Test Equipment

A. The equipment required is listed in Table 702.

PART NO.	DESCRIPTION	PURPOSE	REMARKS
	Container, fuel	Tank leak check	15 in. long x 12 in. depth and width (380 x 300 mm) minimum size.
	Container, fuel	Sealing valve leakage check	Shallow fuel- proof tray.
	Caps, blanking, fuel-proof	Union adapter blanking	12 UNS 14 UNS 18 UNF (1 off each)
	Plate, sealing, fuel-proof	Sealing vent body abutment face	Local manu- facture.

Test Equipment  
Table 702

## 3. Test Sealing Valve for Leakage

- A. Assemble the sealing valve (701-130), together with the helical spring (701-110) and the valve housing (701-115) into the valve body (701-135) and secure with the retaining ring (701-95) (Ref.71-00-01 Stage 2 Assembly).
- B. Place the valve body upright on a suitable container and carefully fill the valve chamber with clean fuel through the 0.150 in. (3,80 mm) diameter hole. Check valve for leakage.

OLYMPUS 593

MK.610-14-28

OVERHAUL

PRINTED IN ENGLAND

4. Test Drains Tank Metered Orifice

- A. Assemble the overflow vent body and sealing valve tested in para.3, to the drains tank (702/90) (Ref.71-00-01 Stage 2 Assembly).
- B. Assemble the drain plug (702/100) to the tank, using a new seal (702/110) (Ref.71-00-01 Stage 2 Assembly).
- C. Assemble a 18 UNF fuel-proof blank to the union adapter above the drain plug location.
- D. Support the tank horizontally, in the installed position, on a tray.
- E. Pour approximately one half pint of clean, filtered fuel into the tank through the unblanked adapter and check that the fuel flows freely from the metered orifice in the filter location bore. If the orifice is obstructed, reject the tank for cleaning and investigation.
- F. Drain off any remaining fuel, then remove the fuel-proof blank and ventilate the tank to dry off the interior.

5. Test Drains Tank for Leakage

- A. Assemble the fuel-proof blanking caps to the three union adapters on the tank to the face of the overflow vent body and its union adapter.
- B. Immerse the complete drains tank assembly in a bath of clean fuel and brush off any surface tension bubbles. Apply air pressure of 2-3 psi (15-20 kPa) for 5 minutes. Watch for any fresh bubbles, paying particular attention to the overflow vent body/drains tank abutment face, the welded seams and union adapter attachment welds. Reject the tank for repair if any leaks are found.
- C. Remove the tank from the bath. Dry off any fuel, using lint-free cloth or a low-pressure air line.

6. Pressure Test Flexible Drain Tubes

- A. Assemble one end of the tube to a suitable pressure source capable of producing 500 psi (3450 kPa), using clean filter paraffin.

TESTING  
**71-70-00**

Page 703  
Dec 1/81

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. Loosely assemble a clean dry pressure blank to the free end of the tube, then raise the pressure slowly to expel air through the pressure blank. When air free flow occurs, tighten the blank and continue to raise the pressure to 500 psi (3450 kPa).
  - C. Lock the pressure in the line and hold for a period of three minutes, flex the tube six times to the minimum bend radius along the entire length of the tube.
- NOTE: The minimum bend radius of the drain tube is 2.00 in. (50 mm) measured to the inside of the bend.
- D. Inspect the tube for leaks paying particular attention to the tube end fittings. Reject the tube if any leaks are found or any drop in pressure occurs.
  - E. Release the pressure and remove the pressure blank, raise the pressure and ensure a full free flow through the tube.
  - F. Drain and dry the tube and assemble clean dry blanks.

This space left blank intentionally

TANK, DRAINS - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

TUBES - FIRST STAGE PUMP AND FCU TO CONNECTION AT  
SECOND STAGE PUMP - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## FUEL SYSTEM DISTRIBUTION - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 304, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301, 302 and 303.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

INSPECTION/CHECK

sneema

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.
- (2) Items to be crack detected by this method are illustrated in the Crack Detection Test Diagram (Fig.301). For details of the processes, refer to 72-09-00 Inspection/Check.

FIG.NO.	ITEM NO.	DESCRIPTION	PROCESS

Items to be Magnetic Particle Crack Tested  
Table 301

B. Fluorescent Dye Crack Detection.

- (1) Submit the items listed in Table 302 to crack detection in accordance with the process quoted. On tubes that are lagged (SB.73-8787-88), apply the dye penetrant fluids to the non-lagged areas only. Avoid getting the penetrant fluids on the lagging. For details of the processes, refer to 72-09-00 Inspection/Check.

OVERHAUL

4. First Stage Pump (302-10)
  - A. Inspect in accordance with vendor's Overhaul Manual (Ref.73-11-01).
5. Second Stage Pump (303-10A or 10B)
  - A. Inspect in accordance with vendor's Overhaul Manual (Ref.73-11-02).
6. Starter Pump (304-10)
  - A. Inspect in accordance with vendor's Overhaul Manual (Ref.73-11-03).
7. Recirculation Valve (305-30)
  - A. Inspect in accordance with vendor's Overhaul Manual (Ref.73-12-01).
8. Distribution and Dump Valve (306-10)
  - A. Inspect in accordance with vendor's Overhaul Manual (Ref.73-12-02).
9. Drain Valve (307-10)
  - A. Inspect Seal Plate Abutment Face, Locating Diameter and Pressure Cap Abutment Face.
    - (1) Wear and fretting.
      - (a) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept.
    - (2) Nicks and burrs. Accept, if repair preserves sealing capability.
  - B. Inspect Valve Stem Head Nut.
    - (1) Peening.
      - (a) Cracking, or nut unsecure. Reject.
      - (b) Peening undamaged, nut secure. Accept.

OVERHAUL

C. Inspect Pressure Cap.

- |                              |   |
|------------------------------|---|
| (1) Nicks and burrs.         | Accept, if repair preserves surface flatness and seal location profile. |
| (2) Seal ring damage.        | Reject for replacement.   |
| (3) Chain damage or missing. | Reject for replacement.   |

10. Inlet Connection Elbow (307-70)

A. Inspect Aircraft Connection Flange.

- |  |   |
|--|---|
| (1) Abutment face.   |   |
| (a) Scores.  |   |
| (i) Less than 0.005 in. (0,130 mm) deep, not extending more than half-way across face. | Accept, if repair preserves sealing capability. |
| (b) Nicks and burrs.   | Accept, if repair preserves sealing capability. |
| (c) Fretting.  | Accept, if repair preserves sealing capability. |
| (2) Locating pins condition (two off).   |   |
| (a) Damaged or loose.  | Reject.   |
| (b) Minor dressable damage; secure in locations.                                       | Accept after repair.                            |
| (3) Clamp ring abutment face.  |   |
| (a) Fretting and wear.   |   |
| (i) Less than 0.005 in. (0,130 mm) deep.   | Accept after repair.                            |

- B. Inspect Seal Plate Abutment Faces (Drain Valve and First Stage Pump).

(1) Nicks and burrs.

Accept, if repair preserves sealing capability.

- C. Inspect Mounting Flange Abutment Face.

(1) Nicks and burrs.

Accept, if repair preserves surface flatness.

- D. Inspect Wire Thread Inserts (Ref.72-09-00 Inspection/Check).

11. Manifold, Top (308-150) and Bottom (308-300)

- A. Inspect Tubes (Ref.72-09-00 Inspection/Check).

- B. Inspect Threads and Union Nuts (Ref.72-09-00 Inspection/Check).

12. Fuel Pressure Atomising (Main) Nozzles - 8 off (309-10)

- A. Inspect Tubes (Ref.72-09-00 Inspection/Check).

- B. Inspect Threads (Ref.72-09-00 Inspection/Check).

CAUTION: DO NOT PROBE THE DISCHARGE NOZZLES WITH HARD OBJECTS, OR DAMAGE MAY RESULT AND GIVE INCORRECT FLOW.

- C. Inspect Discharge Nozzles.

(1) Check for obstruction and carbon deposits.

(a) Obstruction, heavy deposits.

Reject for cleaning (Ref.73-12-05 Cleaning).

(2) Check for damage, using magnifier.

(a) Any damage.

Reject.

- D. Inspect Fuel Nozzles, Ref. Inspection/Check 73-12-05, Page 301.

13. Reheat Injection System (310-10)

- A. Inspect in accordance with vendor's Overhaul Manual  
(Ref.73-12-06).

14. Fuel Pressure Atomising (Pilot) Nozzles - 2 off (311-10) and  
Transfer Tubes - 2 off (311-50)

NOTE: Ensure that each Atomising Nozzle and Fuel Transfer  
Tube (311-50) are kept as a matched set.

- A. Inspect Threads (Ref.72-09-00 Inspection/Check).  
B. Inspect Adjusting Washer Abutment Face and Locating  
Diameter of Nozzle.

(1) Nicks and burrs.

Accept, if repair  
will preserve  
surface flatness  
and location  
profile.

- C. Inspect Fuel Transfer Tube Locations.

(1) Inspect for obstruction and carbon deposits.

(a) Obstruction; heavy  
deposits.

Reject for cleaning  
(Ref.73-10-00  
Cleaning).

- D. Inspect Fuel Transfer Tubes.

(1) Inspect for obstruction and carbon deposits.

(a) Obstruction, heavy  
deposits.

Reject for cleaning  
(Ref.73-10-00  
Cleaning).

- E. Inspect Discharge Nozzles.

CAUTION: DO NOT PROBE THE DISCHARGE NOZZLES WITH HARD  
OBJECTS, OR DAMAGE MAY RESULT AND GIVE  
INCORRECT FLOW.

(1) Obstruction and carbon deposits.

(a) Obstruction, heavy  
deposits.

Reject for clean-  
ing (Ref.73-12-07  
Cleaning).

OVERHAUL

(2) Check for damage, using magnifier.

(a) Any damage.

Reject.

15. Adjusting Washers - 2 off (311-30)

NOTE: Ensure that each Washer is retained with its correct Atomising Nozzle, as reselection may be necessary during assembly.

A. Inspect Abutment Faces.

(1) Nicks, burrs and scores.

Accept provided that repair preserves surface flatness and that designed effective thickness is maintained over 90 per cent of contact face area.

(2) Fretting and wear.

Reject.

16. Brackets (306-460, 309-50/60/70, 312-50/260, 313-80/90, 321-200, 322-280 and 330-90/120)

A. Inspect Brackets.

(1) Distortion.

Accept, if compatibility is preserved.

(2) Wear and fretting.

(a) Attachment face thickness not reduced more than 5 per cent.

Accept.

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm).

Accept after repair.

(3) Nicks and burrs.

Accept after repair.

(4) Scoring.

(a) Not more than 0.010 in. (0,250 mm) in depth.

Accept after repair providing material thickness is not reduced by more than 10 per cent.

17. Bracket (329-170) and Plates (329-60/160)

A. Inspect Bracket and Plates.

- (1) Distortion or cracks. Reject.
- (2) Wear and fretting.
  - (a) Bolt-holes elongated not more than 0.030 in. (0,760 mm); bolt location thickness not reduced more than 5 per cent. Accept.
  - (b) Serrations on bracket.
    - (i) Gouging or deformation. Reject.
    - (ii) Light witness mark only. Accept.
- (3) Nicks, burrs and scores. Accept after repair.

18. Flanged Pins (304-60 - 2 off and 306-30 - 2 off)

A. Inspect Pins.

- (1) Fretting and wear.
  - (a) Smooth, unstepped, not more than 0.0005 in. (0,013 mm) deep. Accept.
- (2) Nicks and burrs. Accept, if repair maintains profile.

19. Retaining Clips - 2 off (311-40)

A. Inspect Clips.

- (1) Distortion. Accept, if repair preserves shape without cracking.
- (2) Wear and fretting.
  - (a) Location or bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

20. Nut Plates (314-170 and 316-370)

A. Inspect Self-locking Nuts and Retainers (Ref.72-09-00).

B. Inspect Plates.

(1) Distortion.

Accept, if repair  
maintains shape  
without cracking.

(2) Nicks and burrs.

Accept, if repair  
preserves surface  
flatness.

21. Tube Assemblies (312-10/230, 313-50, 314-110, 315-160/270,  
316-320, 317-240, 318-50, 319-80/90, 320-80/160, 321-150/290/  
370, 322-80/220/230/440/450, 323-190, 324-20/100/180/280,  
325-100/180/370/490/500, 326-80/170, 327-70/180 and 328-10/  
150/270)

A. Inspect Tubes (Ref.72-09-00 Inspection/Check).

B. Inspect Seal Plate Abutment Faces.

(1) Scores.

(a) Not more than 0.005 in.  
(0,138 mm) deep, and not  
extending across seal  
location.

Accept, if repair  
preserves surface  
flatness and seal-  
ing capability.

(2) Nicks and burrs.

Accept, if repair  
preserves surface  
flatness and seal-  
ing capability.

C. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt-holes elongated not  
more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

D. Inspect Mounting Abutment Faces (321-150, 322-230 and  
327-70).

(1) Nicks and burrs.

Accept after  
repair.

22. Air Bleed Valve Components (327-40/50/60)

NOTE: Carry out this inspection in conjunction with the Oil Cooler to Air Bleed Valve Tube (327-70) (Ref. para. 21.F.).

A. Inspect Air Bleed Valve (327-60).

(1) Inspect seating face.

(a) Scored or pitted. Reject.

(b) Sealing capability unimpaired. Accept.

(2) Inspect seal abutment face.

(a) Nicks, burrs and scores. Accept, if repair preserves surface flatness and sealing capability is unimpaired.

(3) Inspect drilled passages.

(a) Obstruction. Reject for re-cleaning.

(b) Damage. Accept after repair.

B. Inspect Seal (327-50).

(1) Inspect abutment faces.

(a) Nicks, burrs and scores. Accept, if repair preserves surface flatness and sealing capabilities.

C. Inspect Capnut (327-40).

(1) Inspect tube abutment face.

(a) Nicks, burrs and scores. Accept after repair.

(2) Inspect anchor ring (327-30) and chain (327-10/20).

(a) Damaged or missing. Reject for replacement.

23. Adapter (314-240), Blanking Plate (316-290) and Filter Housing (319-110)

A. Inspect Seal Plate Abutment Faces.

(1) Scores.

(a) Not more than 0.005 in. (0,130 mm) deep, and not extending across seal location. Accept, if repair preserves surface flatness and sealing capability.

(2) Nicks and burrs. Accept, if repair preserves surface flatness and sealing capability.

B. Inspect Bolt Locations.

(1) Wear and fretting.

(a) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

C. Inspect Fluid Filter Contact Faces (319-110 Only).

(1) Nicks and burrs. Accept after repair.

(2) Scores at seating face.

(a) Not more than 0.005 in. (0,130 mm) deep. Accept, after repair.

24. Fluid Filters (316-310 and 319-130)

A. Inspect Screen.

(1) Punctures, tears or separation from cage. Reject.

B. Inspect Cage.

(1) Distortion.

Accept, if repair-  
able without  
cracking.

(2) Nicks, burrs and scores.

(a) Not more than 0.002 in.  
(0,050 mm) deep at  
contact faces.

Accept, if unbroken  
contact is retained  
after repair.

(3) Wear and fretting.

(a) Contact faces worn.

Accept after  
repair if sealing  
capabilities are  
unimpaired.

C. Inspect Seal Abutment Faces (320-130 Only).

(1) Scores.

(a) Not more than 0.005 in.  
(0,130 mm) deep, and not  
extending across seal  
location.

Accept, if repair  
preserves sealing  
capability.

25. Connection Block (322-130)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Bolt Locations.

(1) Nicks and burrs.

Accept, if repair  
preserves surface  
flatness.

C. Inspect Tube Seating.

(1) Fretting.

(a) Not more than 0.002 in.  
(0,050 mm) deep.

Accept, if sealing  
capability is  
unimpaired after  
repair.

FUEL SYSTEM DISTRIBUTION - ASSEMBLY

1. General

- A. Prior to commencing the assembly of the first stage fuel pump to the fuel filter and heater, refer to 71-09-00 Assembly for general information.
- B. Where a part is named in the assembly procedure, the Illustrated Parts Catalogue (I.P.C.) item number is given to identify the part from those of similar appearance and description. For example, an item quoted as bolt (72-01-03/1-30) would be found in I.P.C. topic 72-01-03, Figure 1, as item 30.

2. Assemble First Stage Fuel Pump to Fuel Heater and Filter

A. Prepare for Installation.

- (1) Remove support links and their attachment items from the heater.
- (2) Assemble inlet elbow and drain valve (73-12-03/1-70-10) to first stage fuel pump inlet (Ref.Fig.501).
- (a) Assemble seal plate (73-12-03/1-100) over inlet elbow.
- (b) Align attachment holes, inlet elbow drain valve downward, and engage spigot with first stage pump.
- (c) Apply lubricant 'B' to bolts (73-12-03/1-80). Insert bolts and torque-tighten between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (3) Ensure a serviceable seal plate is secured to the fuel pump outlet mounting faces with screws (73-11-01/1-280-270). Ensure that screw heads are below face of seal when in assembled condition.

B. Secure the joint flange between pump and heater (Ref. Fig.501).

- (1) Apply lubricant 'B' to the bolts (73-14-01/1-20).
- (2) Align the heater with the pump with joint flanges/ seal plate faces in full abutment.

OVERHAUL

- (3) Verify that flange alignment is correct and screw in attachment bolts.

NOTE: Four bolts are entered downward through the heater flange and four upward through the pump outlet flange. The four bolts that are entered upward have flat washers (73-14-01/1-30) fitted.

- (4) Torque-tighten the bolts evenly, in diametrically opposed pairs, between 67 and 73 lbf in. (7,6 and 8,2 N.m).
- (5) On engines to pre SB.73-38 standard, use a 0.0015 in. (0,038 mm) feeler gauge and check for incorrect seating of boltheads.
- (6) Carry out the requirements of SB.73-38 at locations where the feeler gauge check has indicated incorrect seating.

C. Install pump to heater support links (Ref.Fig.502).

- (1) Install the upper short support link (Detail B).
  - (a) Assemble link outer end to inlet elbow.
    - (i) Assemble eight shims to headed bush.
    - (ii) Assemble headed bush to link.
    - (iii) Apply lubricant 'B' and insert attachment bolt through headed bush, link and inlet elbow then assemble flat washer and nut. Lightly tighten nut.
  - (b) Assemble link inner end to heater.
    - (i) Align attachment holes.
    - (ii) From set of eleven 0.010 in. shims removed with link, select the number required to fill gap between adjacent faces of link and heater.
    - (iii) Place remaining shims of set over headed bush and assemble bush to link with selected shims between link and heater.

TN5311

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (iv) Apply lubricant 'B' and secure the assembly with a bolt, torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (c) Torque-tighten nut on bolt securing link to inlet elbow between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) Install the lower short support link (Detail A).
- (a) Assemble link inner end to heater.
- (i) Apply lubricant 'B' to retaining bolt.
- (ii) Insert bolt through link to engage with heater and lightly tighten.
- (b) Assemble link outer end to inlet elbow.
- (i) Align attachment holes.
- (ii) From set of nine 0.010 in. shims removed with link, select the number required to fill the gap between adjacent faces of link and elbow.
- (iii) Place remaining shims of set over headed bush and assemble bush to link with selected shims between link and elbow faces.
- (iv) Insert bolt through bush from headed side, assemble washer and nut to bolt. Torque-tighten nut between 85 and 95 lbf in. (9,6 and 10,7 N.m) using lubricant 'B'.
- (c) Torque-tighten bolt securing link to heater between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) Install long support link (Detail C).
- (a) Determine number of shims required between link upper attachment and heater unit.
- (i) Assemble eccentric bush in link lower attachment hole, aligning one slot in bush and link face. Engage lockplate with aligned slots.

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- (ii) Position link on elbow flange and secure with bolt washer and nut.
- (iii) From set of eleven 0.010 in. shims removed with link, select the number required to fill gap between adjacent faces of link and heater with attachment holes aligned as near as possible.
- (iv) Remove link for assembly of shims.
- (b) Position remaining shims of set not required to fill gap over top attachment headed bush. Insert bush through link top attachment hole with head on same side of link as slots at other end.
- (c) Place selected shims to fill gap over bush end. Apply lubricant 'B' to bolt, position link and secure with bolt lightly tightened.
- (d) Assemble link lower end to inlet elbow.
  - (i) Align holes in link and elbow.
  - (ii) Engage eccentric bush with link hole and rotate it until it freely engages with attachment hole.
  - (iii) If a slot in bush does not align with a slot in link face adjust bush to bring two nearest slots into alignment.
  - (iv) Assemble lockplate with its key engaging slot and insert bolt. Apply lubricant 'B' and assemble flat washer and nut.
- (e) Torque-tighten nut on lower attachment bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m) ensuring that lockplate remains in position in slots.
- (f) Torque-tighten upper attachment bolt between 85 and 95 lbf in. (9,6 and 10,7 N.m).

OVERHAUL

D. Install Fuel Differential Pressure Switches.

- (1) Install fuel differential pressure warning switch on heater and filter unit (Ref.Fig.503).

CAUTION: ENSURE ATTACHMENT BOLTS AND THEIR  
CORRESPONDING THREADED HOLES ARE TO THE  
SAME SERVICE BULLETIN STANDARD.

- (a) Apply lubricant 'B' to bolts (73-31-01/1-15).
  - (b) Assemble a serviceable seal plate (73-31-01/1-60) to pressure switch (73-31-01/1-10) with assembly pin engaged and attachment holes aligned.
  - (c) Locate switch and seal plate on upper location of fuel heater unit and retain in position with five bolts lightly tightened.
  - (d) Torque-tighten attachment bolts between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (2) On engines to pre SB.73-41 standard, install fuel heater control valve differential pressure switch/fuel servo tube front section on heater and filter unit (Ref.Fig.503).

CAUTION: ENSURE ATTACHMENT BOLTS AND THEIR  
CORRESPONDING THREADED HOLES ARE TO  
THE SAME SERVICE BULLETIN STANDARD.

- (a) Apply lubricant 'B' to bolts (73-14-04/1-15).
- (b) Ensure stepped pin (73-13-13/1-30) is secure in the fuel tube plate and protrudes from the face that mates with the heater.
- (c) Assemble the differential pressure switch, fuel tube and two serviceable seal plates in preparation for installation.
  - (i) Assemble the switch (73-14-04/1-10) to the fuel tube plate (73-13-13/1-10) with a seal plate (73-14-04/1-60) between the mating faces and hold with the switch assembly pin engaged and attachment holes of switch and seal and tube plates aligned.

OVERHAUL

- (ii) Assemble a seal plate (73-13-13/1-20) to the free face of the fuel tube plate with stepped pin engaged and attachment holes aligned.
- (iii) Insert two bolts to keep the assembled items together.
- (d) Position assembled items on heater location with fuel tube correctly orientated and stepped pin engaged. Retain items in position with two of the bolts hand tight.
- (e) Screw in the remaining bolts and secure the switch and plate with the five bolts, torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).
- (3) On engines to SB.73-41 standard (Ref.Fig.503), install blanking cover/fuel servo tube front section on heater and filter unit.

**CAUTION:** ENSURE ATTACHMENT BOLTS AND THEIR CORRESPONDING THREADED HOLES ARE TO THE SAME SERVICE BULLETIN STANDARD.

- (a) Apply lubricant 'B' to bolts (73-14-04/1-55).
- (b) Ensure stepped pin (73-13-13/1-30) is secure in the fuel tube plate (73-13-13/1-10) and protrudes from the face that mates with the heater.
- (c) Assemble the blanking cover (73-14-04/1-53), fuel tube plate and two serviceable seal plates (73-14-04/1-60 and 73-13-13/1-20) in preparation for installation.
- (i) Assemble one seal plate to the fuel tube plate face with the protruding stepped pin and hold in position with pin engaged and attachment holes of both items aligned.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- (ii) Locate and hold the second seal plate against the other fuel tube plate face in a position that corresponds with the first seal plate. Ensure that the two central sealed holes of the seal plates are coincident with the holes in the fuel tube plate and then position the blanking cover against the seal with the attachment holes aligned.
- (iii) Insert two bolts to keep the assembled items together in the required relative positions.
- (d) Position assembled items on heater location with fuel tube correctly orientated and stepped pin engaged. Retain items in position with the two bolts hand tight.
- (e) Screw in the remaining bolts and secure the cover and plate with the five bolts, torque-tighten between 85 and 95 lbf in. (9,6 and 10,7 N.m).

## FIRST STAGE FUEL PUMP - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

73-11-01

Page 201

OLYMPUS 593  
MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## DISTRIBUTION AND DUMP VALVE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## FUEL INLET ELBOW AND DRAIN VALVE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## FUEL MANIFOLD - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## FUEL NOZZLES ASSEMBLY - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. (Tool 123). For the manufacturer's  
Part No. refer to the appropriate Table in Special Tools,  
Fixtures and Equipment Section.

### 2. Cleaning Components

**CAUTION:** BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-  
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY  
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L  
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME  
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING  
NECESSARY.

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should remain  
therein during the cleaning procedures unless otherwise  
stated.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.
- D. Certain components are subject to Controlled Manufacturing Technique (CMT) procedures. The cleaning of these components is critical and variations from the specified cleaning procedures and solutions are prohibited without approval from the engine manufacturer. All components to which this applies are identified as such in the Remarks column of the Cleaning Processes Table.

FUEL NOZZLES ASSEMBLY - INSPECTION/CHECK1. General

- A. Acceptance limits for inspection of fuel nozzle assemblies are given in TSD.594-409 Appendix 2.
- B. This chapter gives general X-ray examination procedure for fuel nozzle assemblies.
- C. Each item in this chapter is given a two-part identification; thus, 301-10 refers to Figure 301 and to Item 10 called out on that figure. Each item may be further identified by its Part Number by the use of Table 301, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.

2. X-Ray Examination

- A. X-ray examination of nozzle assembly (301-10).

NOTE: The welds and wall thickness X-ray can be carried out at the same time if necessary.

- (1) X-ray data
  - Film - Ultra fine grain; to be used with lead screens
  - Shots per weld - Two at right angles to one another
  - Angle of beam - 90° to weld
  - Kilo voltage - 140-160
  - Milliamps per second - 600 approx.
  - Focal film distance - 36 in (914.4 mm)
  - Sensitivity - 2% or better
- (2) X-ray the four welds shown in Figure 1 in accordance with TSD 594-409 Appendix 2. Reject the nozzle assembly if any non-conformance with the acceptance standard of Appendix 2 is identified.

2. REPAIR LIMITATIONS

CAUTION: COMPLIANCE WITH ALL ASPECTS OF THIS REPAIR PROCESS SHOULD BE ACHIEVED WITHOUT DEVIATION. WHERE A NEED TO DEVIATE IS CONSIDERED NECESSARY, REFERENCE SHOULD BE MADE TO THE REPAIR AUTHORITY FOR AGREEMENT.

NOTE: Report on weld samples, for welds with and without Welding Rings, to be sent to Rolls Royce plc.

This Repair Scheme is issued to repair defects found within the fabrication welds and thin wall sections in Splitter Union after inspection to SB.0L.593-73-8827-92.

THE REPAIR PROCEDURE IS IN 4 PARTS.

PART 1: Repairs defects found within the Splitter Connector and attachment welds, (Joint A, see Fig.401), by replacing the Splitter Connector.

PART 2: Repairs defects found within the attachment weld between the convoluted tube and the sprayer attachment flange (Joint B see Fig.401) by replacing the convoluted tube, together with the Splitter Connector.

PART 3: Repairs defects found within the Disperser Head attachment weld (Joint C, see Fig.401), by replacing the Disperser Head.

PART 4: Replacement of defective sprayer(s) LH and/or RH.

OVERHAUL

### 3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimeters)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 63 (1,6) Microinches (Micrometers)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

All TASKS identified in this instruction are in the Engine Overhaul Processes Manual (TSD594-J).

To identify the consumable materials, refer to the Overhaul Materials Manual (OMat).

### 4. REPAIR PROCEDURE

### SUPPLEMENTARY INFORMATION

#### PART 1:

- |    |  |  |
|----|--|--|
| 1) | Solution heat treat at<br>980°C $\pm$ 10°C for 30 minutes<br>in a vacuum furnace. Rapid<br>cool in argon or nitrogen.  |  |
| 2) | Remove the Splitter Connector<br>and trim back convoluted tube<br>ends to centre of weld line<br>square to axis of tube centre<br>line.  | Use conventional hand tools.<br>Discard the Connector.   |
| 3) | Radiologically inspect the<br>remaining portion of weld<br>joint.  | Refer to Para.6. DATA.<br>Refer to TASK<br>70-00-00-300-409 SUBTASK<br>70-00-00-260-409-001.<br>Refer to APPENDIX B. |
| 4) | If defects are found in trimmed<br>ends during radiological<br>inspection, trim back square to<br>axis of tube centre line until<br>all defects found at OP 3) are<br>removed. | Use conventional hand tools.   |
| 5) | If required Repeat OP 3) to<br>ensure defects are removed.   | Consider reworking to Part<br>2 if defect cannot be<br>eliminated.   |

## REPAIR PROCEDURE

- 6) Fit new Splitter Connector.  
Loosely assemble to tube ends.  
Dimensionally inspect the  
assembly as shown.
- 7) Disassemble and prepare all  
items for welding.
- 8) Reassemble parts and using  
the appropriate fixtures  
orbital weld the joints.
- 9) Crack detect.
- 10) Radiologically inspect welds  
and residual wall thickness of  
the Splitter using a graticule  
scale. If thickness is less  
than 0.040 (1,02) reject assembly.
- 11) Heat treat at  $720^{\circ}\text{C} \pm 10^{\circ}\text{C}$   
for 16 hours in argon.  
Rapid cool in argon.
- 12) Polish the assembly to achieve  
a surface finish of 63 micro-  
inches (1,6 micrometres).
- 13) Calibrate the Fuel Sprayer.
- 14) Dimensionally inspect.

## SUPPLEMENTARY INFORMATION

Refer to Figs.401 to 404.  
Refer to Para.8B and 8C  
PARTS.  
If necessary remove integral  
lip on new item 3 Splitter  
Connector and fit Welding  
Ring item 8 to adjust pipe  
length. Ensure the ends  
remain square.

Refer to TASK  
70-00-00-300-409.

Refer to TASK  
70-00-00-300-409.  
Refer to Para.7. TOOLS.  
Refer to Para.6B(1).  
WELD DATA.

Refer to TASK  
70-00-00-200-213.

Refer Para.6A. DATA.  
Refer to Fig.405.  
Refer to TASK  
70-00-00-300-409 SUBTASK  
70-00-00-260-409-001.  
Refer to APPENDIX B.

Refer to APPENDIX A.

Refer to Figs.401 and 402.  
Refer to Para.7. TOOLS.

## REPAIR PROCEDURE

- 15) Hydraulic pressure check the Fuel Sprayer with fuel or water at a pressure of 13800 Kpa (2000 psi), for at least 1 minute. If any leaks are observed reject the assembly.
- 16) On completion of the pressure test inhibit the unit with inhibiting fluid.
- 17) Mark repair identity number B512846/1 or R1/1 adjacent the Assembly Part Number.

## SUPPLEMENTARY INFORMATION

Lubricate the threads of the Splitter with OMat 1003. Max tightening of Splitter 46.1 Nm (34 lbf/ft).

Use OMat 1003 or OMat 1003D.

Vibro Percussion engrave in accordance with chapter 72-09-00 (Repair).

## PART 2:

### REPAIR PROCEDURE

- 1) Solution heat treat at  $980^{\circ}\text{C} \pm 10^{\circ}\text{C}$  for 30 minutes in a vacuum furnace. Rapid cool in argon or nitrogen.
- 2) Remove the Splitter Connector and Convolute tube. Trim remaining parts of assy to centre of weld line square to axis of tube centre line.
- 3) Radiologically inspect the remaining portion of weld joint.
- 4) If defects are found in trimmed ends during radiological inspection, trim back square to axis of tube centre line until all defects found at OP 3) are removed.
- 5) If required Repeat OP 3) to ensure defects are removed.

### SUPPLEMENTARY INFORMATION

Use conventional hand tools. Discard the Connector/tube.

Refer to Para.6A. DATA.  
Refer to TASK  
70-00-00-300-409 SUBTASK  
70-00-00-260-409-001.  
Refer to APPENDIX B.

Use conventional hand tools.

PART 4:

REPAIR PROCEDURE

SUPPLEMENTARY INFORMATION

- 1) Solution heat treat at 980°C  $\pm$  10°C for 30 minutes in a vacuum furnace. Rapid cool in argon or nitrogen.
- 2) Remove the Sprayer(s) from the Sprayer assembly by cutting through on the scrap side near the attachment welds. Trim back to the centre of the existing weld line(s) square to axis of tube centre line.

Refer to Fig.401.  
Use conventional hand tools.  
Discard the Sprayer tube(s).

NOTE: If existing Spray Disperser(s) are in good condition, trim the end(s) back to the centre of the existing weld line(s) square to axis of Disperser centre line(s). Retain for re-assembly. Discard if not in good condition.

- 3) Radiologically inspect the trimmed ends on both the Convolute tube(s) and Spray Disperser(s) (if required).
- 4) If defects are found in trimmed ends during radiological inspection, trim back square to axis of tube centre line until all defects found at OP 3) are removed.

Refer to Para.6A. DATA.  
Refer to TASK  
70-00-00-300-409 SUBTASK  
70-00-00-260-409-001.  
Refer to APPENDIX B.

Use conventional hand tools.

NOTE: If defects cannot be removed - replace the part(s).

- 5) If required Repeat OP 3) to ensure defects are removed.

## APPENDIX A

### 1. Calibrate the Fuel Sprayer as follows:

- A. With a fuel feed of 100 psi, measure and record the quantity of fuel sprayed from each Disperser end hole of each injector simultaneously for a duration of 60 seconds.
- B. Taking the largest quantity of fuel sprayed from one of the four Disperser holes as (A) cc. and the lowest quantity as (B) cc then  $\frac{A - B}{A + B}$  must be less than 0.025 (0,064).  
If  $\frac{A - B}{A + B}$  is greater than 0.025 (0,064), ream hole B to achieve requirement. Record final quantities.
- C. With a fuel feed of 100 psi, measure and record the overall flow. The flow limits for each bifurcated fuel injector are between 380 and 390 gph. If the measured flow is not within this range, ream out the metering holes in the splitter block until it does. Record the final flow.

NOTE: If after this operation the fuel flow is in excess of the required figures, remove and replace the Disperser Heads in accordance with Part 3 of this Repair Scheme.

- D. Recheck paras B. and C. at 25 psi. Record the result only - do not ream any holes.
- E. Radiologically inspect residual wall thickness of the bifurcated union body, from the top as shown at Fig. 405. Using a graticule scale, measure the wall thickness. Reject the Fuel Sprayer assembly if less than 0.040 (1,02) thick. Refer to Para.6.A. DATA.

APPENDIX B

## 1. ACCEPTANCE STANDARD - RADIOGRAPHIC INSPECTION REQUIREMENT

<u>FEATURE</u>	<u>ACCEPTANCE STANDARD</u>
A. Undercutting and Shrinkage.	Up to 0.1 't' providing no sudden change of section or sharp edges are evident.
B. Stop Crater.	Up to 1 't' dia and 0.25 't' deep.
C. Malalignment.	Up to 0.15 't' or 0.005 (0,13) whichever is the greater.
D. Tungsten Inclusions.	A maximum of 2 inclusions up to 0.75 't' dia providing they are fully entrapped within the weld bead and have a minimum separation of 0.197 (5,00).
E. Pores.	Up to 0.5 't' dia in the weld bead but restricted to 0.25 't' dia in the blend of the bead to the parent material. Minimum separation 2 't' maximum number 5. Pores are not acceptable in the HAZ.
F. Weld Bead.	Up to 1 't' max height of crown or under bead providing the overall weld section does not exceed 2.25 't'. Width may vary between 2.5 't' and 5 't'. Sudden variations are not acceptable.

NOTE: Flow considerations may impose an overriding restriction relative to height of under bead.

FUEL SPRAYER ASSEMBLY -  
REPAIR OF LIGHT IMPACT DAMAGE ON THE OUTER SURFACE OF FUEL  
SPRAYERS BY BLENDING  
B518171

1. EFFECTIVITY

<u>IPC</u>	<u>Fig./Item</u>	<u>Part No.</u>
73-12-05	1/10A	B481733

2. REPAIR LIMITATIONS

Compliance with all aspects of this Repair Process shall be achieved without deviation. Where a need to deviate is considered necessary, reference shall be made to the Repair Authority for agreement.

This instruction gives the procedure for repair of light impact damage on the outer surface of the Fuel Sprayers by blending on the Fuel Sprayer Assembly.

Validation testing is not required for this Repair Instruction.

Impact damage up to 0.005 (0,127) maximum depth x 0.150 (3,81) x 0.100 (2,54) maximum area is acceptable for repair within Sprayer(s) LH and/or RH.

Repair may be applied more than once, provided that the above limitations are not exceeded in any one area.

3. GENERAL

UNLESS OTHERWISE SPECIFIED

Drawing practice & tolerance interpretation to ISO1101 (JES160)

Dimensions in Inches (Millimeters)

Tolerances on machined dimensions plus/minus 0.010 (0,25)

Tolerance on angles plus/minus 2 degrees

Break sharp edges 0.004 to 0.020 (0,1 to 0,5)

Surface texture interpretation to ISO1302 (JES137)

Surface texture to be 63 (1,6) Microinches (Micrometers)

Welding symbols to ISO2553 (JES139)

3rd Angle Projection

All TASKS identified in this instruction are in the Engine Overhaul Processes Manual (TSD594-J).

To identify the consumable materials refer to the Overhaul Materials Manual (OMat).

## 4. REPAIR PROCEDURE

- 1) Hand blend to remove damage marks, producing smooth and continuous profiles.  
Remove a minimum amount of material.  
  
NOTE: No blending to be carried out within 0.250 (6,35) of weld joint lines.
- 2) Polish the repaired area.
- 3) Dimensionally/visually inspect repair area(s).
- 4) Do a penetrant crack test on the repair area.
- 5) Hydraulic pressure check the fuel sprayer with fuel or water at a pressure of 13800 Kpa (2000 psi), for at least 1 minute. If any leaks are observed reject the assembly.
- 6) On completion of the pressure test, inhibit the unit with inhibiting fluid.
- 7) Do a dimensional inspection of the part.
- 8) Mark repair identity number B518171 or R2 adjacent the assembly part number.

## SUPPLEMENTARY INFORMATION

Use hand held tools.  
Refer Overhaul Manual Chapter 72-09-22.  
Repair.  
Refer to Repair Limitations.  
Refer to Figure 401.

Polish to remove the scratches and give a surface finish of 63 microinches (1,6 micro-metres).

Refer to Repair Limitations.  
Use inspection equipment.  
Reject if outside limits.

Refer to TASK 70-00-00-200-213  
SUBTASK 70-00-00-230-213-002.  
Use OMat 653 Fluorescent penetrant, medium sensitivity.  
Cracks are not permitted.  
Use penetrant crack test equipment.

Lubricate the threads of the splitter with OMat 1003.  
Max tightening of splitter 46.1 Nm (34 lbf/ft).

Use OMat 1003 Mineral oil (fuel system inhibitor) or OMat 1003D Mineral oil.

Refer to existing repair instruction 73-12-05 Repair No.1.

Vibro Percussion engrave in accordance with Chapter 72-09-00 Repair.

## REHEAT INJECTION SYSTEM - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

73-12-06

Page 201

Jan 1/77

OLYMPUS 593

MK.610-14-28  
OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## FUEL PRESSURE ATOMIZING (PILOT) NOZZLE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

**CAUTION:** BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

OLYMPUS 593

MK.610-14-28

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## FUEL PRESSURE ATOMISING (PILOT) NOZZLE - TESTING

### 1. General

- A. Nozzle assemblies are to be subjected to a Calibration Check after having completed a life of not more than 3000 hours, and subsequently at intervals of not more than 3000 hours.

### 2. Testing

#### A. Calibration Check

- (1) Remove all blanks, covers etc from the nozzle assembly.
- (2) Ensure the fuel transfer tube is fitted to the assembly.
- (3) Mount the nozzle assembly on a suitable fuel test rig and connect the rig inlet fuel tube to it.
- (4) Start the rig and apply a fuel pressure of 25 p.s.i. to the nozzle assembly and check:
  - (a) That the flow number is between 1.3 and 1.6 (6.5 to 8 galls./hr.).
  - (b) That the spray angle cone is between  $75^{\circ}$  and  $100^{\circ}$ .
  - (c) That the atomiser angles (ref. Figure 1) are  $40^{\circ}$  plus/minus  $10^{\circ}$  and  $15^{\circ}$  plus/minus  $5^{\circ}$ .
- (5) Release the pressure, switch off the rig and remove the nozzle assembly.
- (6) If the limits are satisfactory, no further action is required. If the limits are unsatisfactory, clean the nozzle assembly as detailed in para. B and repeat the calibration; repeat as necessary.
- (7) Repeat the calibration on the second nozzle assembly.
- (8) Reassemble all blanks, covers etc to nozzle assembly.

## B. Cleaning Procedure

- (1) On engines pre SB.73-13 standard, remove the fuel transfer tube using a suitable threaded extractor.
- (2) On engines to SB.73-13 standard, withdraw the fuel transfer tube using a suitable threaded extractor, until the tube engages the internal thread in the nozzle assembly. Unscrew the tube and remove it from the nozzle assembly.
- (3) Mechanically clean the 0.050 in. (1.27 mm) bore of the tube with a suitable gauged wire, then flush out with a degreasing agent (Genklene 1:1:1).

CAUTION: DURING THE FOLLOWING OPERATION, DO NOT ATTEMPT TO CLEAN THE ATOMISER IN THE END OF THE NOZZLE ASSEMBLY WITH ANY METALLIC OBJECT.

- (4) Clean the nozzle assembly (less the fuel transfer tube) using process G or M, as detailed in the Overhaul Manual 72-09-00 but for 10 hours, then flush out with a degreasing agent.
- (5) Re-assemble the fuel transfer tube to the nozzle assembly and inhibit using fluid to specification DERD 2490 or DEF 2001A.

## TUBES - FIRST STAGE PUMP TO SECOND STAGE PUMP - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

TUBES - FLOW CONTROL UNIT SUPPLY TO FUEL MANIFOLD - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. (Tool 123). For the manufacturer's  
Part No. refer to the appropriate Table in Special Tools,  
Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should remain  
therein during the cleaning procedures unless otherwise  
stated.
- B. All items contained in this breakdown must be cleaned by  
the appropriate processes quoted in the table, to achieve  
a cleanliness to enable the Inspection/Check to be carried  
out correctly. Where alternative processes are quoted,  
the operator must decide what process to use depending on  
the amount of contamination of the item. Any item that is  
not cleaned satisfactorily must be recleaned by the  
appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBES - REHEAT CONTROLLER AND FLOW CONTROL UNIT SPILL  
TO FIRST STAGE PUMP INLET ELBOW - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

FUEL HEATER CONTROL VALVE SWITCH - CLEANING

1. General

- A. Refer to S.B.73-8466-41. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

FUEL HEATER CONTROL THERMOMETER - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

FUEL SYSTEM CONTROL - INSPECTION/CHECK

1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

3. Crack Detection

A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

**CAUTION:** ENSURE THAT THE HIGHEST POSSIBLE STANDARD OF CLEANLINESS IS OBSERVED WHEN HANDLING FUEL SYSTEM COMPONENTS. BECAUSE OF THE SMALL OPERATING CLEARANCES IN THE CONTROL UNIT, ANY CONTAMINATION MAY LEAD TO MALFUNCTION OF THE SYSTEM.

4. Engine Flow Control Unit (302-10)

- A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-21-04).

5. LP Compressor Speed Probe Unit (303-10)

- A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-22-01).

6. Reheat Fuel Controller (304-10)

- A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-23-01).

7. Purge Reheat Solenoid Valve (305-10)

- A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-24-01).

8. Brackets (303-40 and 304-70)

- A. Inspect Brackets.

(1) Distortion.

Accept if compatibility is preserved.

INSPECTION/CHECK

**73-20-00**

Page 304

(2) Wear and fretting.

(a) Attachment face thickness reduced not more than 5 per cent. Accept

(b) Bolt-holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

(3) Nicks and burrs. Accept after repair

(4) Scores.

(a) Not more than 0.010 in. (0,250 mm) in depth. Accept after repair providing material thickness is not reduced by more than 5 per cent.

9. Flanged Pin (304-50) and Distance Piece (304-120)

A. Inspect Pin and Distance Piece.

(1) Nicks and burrs. Accept if repair preserves location profile and surface flatness.

10. Support Cone (304-150)

A. Inspect Abutment Face.

(1) Reduction of flange thickness not more than 5 per cent. Accept.

(2) Nicks and burrs. Accept if repair preserves surface flatness.

B. Inspect Bolt Locations.

(1) Nicks and burrs. Accept if repair preserves surface flatness of washer locations.

INSPECTION/CHECK

ENGINE FLOW CONTROL UNIT - CLEANING

L. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## FUEL SYSTEM INDICATION - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.
  - (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

**CAUTION:** ENSURE THAT THE HIGHEST POSSIBLE STANDARD OF CLEANLINESS IS OBSERVED WHEN HANDLING FUEL SYSTEM COMPONENTS. BECAUSE OF THE SMALL OPERATING CLEARANCES IN THE CONTROL UNITS, ANY CONTAMINATION MAY CAUSE MALFUNCTION OF THE SYSTEM.

4. Fuel Differential Pressure Warning Switch (302-10)

A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-31-01).

5. Fuel Nozzle Inlet Thermometer (303-10A or 10B)

A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-32-01).

6. Engine Fuel Flowmeter (304-10)

A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-33-01).

7. Reheat Fuel Flowmeter (305-10)

A. Inspect in accordance with the vendor's Overhaul Manual (Ref.73-33-02).

## FUEL DIFFERENTIAL PRESSURE WARNING SWITCH - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

**73-31-01**

Page 201

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## REHEAT FUEL FLOWMETER - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## HIGH ENERGY IGNITION UNIT - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

## HIGH ENERGY IGNITION UNIT - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

- (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

## IGNITION DISTRIBUTION SYSTEM - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-10 refers to Figure 302 and to Item 10 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.

(1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

## CONCORDE

### OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 74-501  
Insert in 74-20-00 after page 304

#### REASON FOR ISSUE:

Ignition leads (P/N's B479405, B487558 and B495471) which have been removed from an engine installed in an aircraft or engines located in Engine Shop, LHR, are to have the following workshop check carried out (DDA A256/10).

#### ACTION

High energy ignition leads - Workshop check

1. Ultra sonically clean the ignition lead.
2. Using genklene, clean the ceramic and button.
3. Inspect ceramic for cracks and chips.
4. Inspect button for erosion or burning.
5. Inspect ferrules and nuts for tightness and security of locking.
6. Inspect ceramic and button for security on conductor
  - A. P/N's B479405 and B487558 are brazed joint.
  - B. P/N B495471 is a crimp joint.
7. Inspect convoluted tubing for tears and punctures and clips securely locating tubing on ferrules. Ensure that seal is in position on elbow.

#### Testing.

1. High voltage test between outer metal braiding and conductor - 5KV. for 1 minute.

NOTE: Operational voltage 2KV. at 8 joules 70 sparks/minute.

2. Continuity test as per 74-21-01 page 702 paragraph 3B(2) (a), followed by bonding resistance test as per 74-21-01 page 702 paragraph 3B(3) (a).

OVERHAUL

(2) Security.

(a) Manipulate insulator to  
check security.

(i) Insulator secure                      Accept.  
on cable.

C. Inspect Connector Assembly and Ferrules (Ref.72-09-00  
Inspection/Check).

D. Inspect Union Nut Sealing Washer.

(1) Security and general condition.

(a) Washer secure in                      Accept.  
location; free of  
cracks or distortion.

E. Inspect Elbow.

(1) Security.

(a) Joint at retaining                      Accept.  
collar sound and  
intact.

(2) Distortion.

(a) No excessive                      Accept.  
misalignment.

(3) Dents.

(a) Shallow, smooth-                      Accept.  
contoured, not crush-  
ing cable.

F. Inspect Ferrule (Ref.72-09-00 Inspection/Check).

G. Inspect Clip.

(1) Security.                      Accept.

(a) Correctly positioned on  
ferrule; convoluted  
tubing secure.

H. Inspect Convolute Tubing.

- |                         |  |
|-------------------------|--|
| (1) Tears or punctures. | Reject.  |
| (2) Burning.            | Reject.  |
| (3) Heat deformation.   | Accept, subject to<br>satisfactory<br>electrical checks. |
| (4) Compression.        | Accept, subject to<br>satisfactory<br>electrical checks. |

NOTE: Pay particular attention to clip  
locations.

J. Carry Out Electrical Checks (Ref.74-21-01 Testing).

5. Igniter Plugs - 2 off (303-10)

- A. Inspect in Accordance with the vendor's Overhaul Manual  
(Ref.74-21-02).

6. Spacer Washer (303-20)

- NOTE: This item requires selection during assembly. Used  
washers will be discarded at overhaul.

7. Reheat Igniter Assembly (304-10)

- A. Inspect in Accordance with the vendor's Overhaul Manual  
(Ref.74-22-01).

TR Page 1 of 2  
11 March 1991

CONCORDE  
ENGINE  
OVERHAUL MANUAL (ATP E7925)

This Temporary Revision complies with BCAR Chapter A5-3, B5-3 and/or TSS No. 0-2 as appropriate  
for Chief Engineer (Technical & Quality Services) CAA Design Approval No.  
DAI/8566/78.

*W. Chubb*

TEMPORARY REVISION No 74-A

Manual Reference 74-21-01 Page 101

REASON FOR REVISION

To include High Energy Ignition Lead Refurbishment Schedule Specification No.  
CON 74-21-01-100 issue 1 (MCR.EPA.3.4215.20.MD).

ACTION

Refurbishment Specification

1. The work schedule listed below is to allow the High Energy Ignition Lead to be considered as a "Condition Monitored Unit". This means that this unit is considered to have no known hidden "Wear Out" features that require planned time interval specific inspections. However, such units may be required to be stripped and inspected purely to gain experience of their condition.
2. The requirement to refurbish units is controlled by the Approved Maintenance Schedule.
3. Where the term "Visual Inspection" is used it implies a visual inspection of all parts exposed arising either as a result of the minimum work content of the refurbishment schedule or to a greater extent of strip indicated by other reasons, i.e. repair of damage, embodiment of modifications etc.
4. During refurbishment of a unit, modifications are to be embodied in accordance with the BA call-up list.
5. Ultrasonically clean the unit.
6. Using Genklene, clean the ceramic insulators and contact caps.
7. Inspect the ceramic insulators for cracks and chips.
8. Inspect the contact caps for erosion or burning.
9. Inspect the ferrules and nuts for tightness and security of locking.
10. Inspect the ceramic insulators and contact caps for security on conductor. Note: part no. B487558 is a brazed joint and part No's B495471 and 4ba14333 are crimped joints.
11. Inspect the convoluted tubing for tears and punctures and that the clips are securely locating the tubing on the ferrules. Ensure that the seal is in its correct position on the elbow.

CONCORDE  
ENGINE  
OVERHAUL MANUAL (ATP E7925)  
TEMPORARY REVISION No 74-A (Cont'd)

12. Test unit as follows:-

- a) High voltage test between outer metal braiding and conductor. 5KV for 1 min.  
Note: operational voltage is 2KV at 8 joules and 70 sparks per min.
- b) Continuity test the conductor using tester. During test flex the lead to reveal discontinuities.
- c) The bonding resistance check of the outer cable is not to exceed 0.05 ohms.

13. The unit's inspection and release documentation is to state that the unit has been refurbished in accordance with Specification CON 74-21-01-100 Issue 1.

## HIGH ENERGY IGNITION LEAD - DISASSEMBLY

### 1. General

- A. The section contains the procedure for the disassembly required to replace an unacceptable item following inspection or trouble shooting.
- B. The procedures for the removal of the high energy ignition leads from the power plant are detailed in 71-00-02 Electrical Harness and Ignition Leads - Disassembly.

### 2. Disassembly of the Ignition Lead (Pre SB.0L.593-74-9084-19 standard)

#### A. General.

This procedure is only to be performed when an unacceptable item is to be replaced.

#### B. Removal of the Elbow Assembly (Ref.Fig.101).

- (1) Unsolder the contact cap from the core. Remove the contact cap and the insulator.
- (2) Remove lock wire connecting the ferrule and the elbow assembly and unscrew the connection.
- (3) Withdraw the elbow assembly from the cable and remove the seal.

#### C. Removal of the Connector Assembly (Ref.Fig.101).

- (1) Unsolder the contact cap from the core. Remove the contact cap and the insulator.
- (2) Remove the clip securing the conduit to the connector and draw back to expose the integral ferrule of the connector.
- (3) Unsolder the integral ferrule of the connector from the flexible metal tubing.
- (4) Withdraw the connector from the cable.

## HIGH ENERGY IGNITION LEADS - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

74-21-01

Page 201

# OLYMPUS 593

MK.610-14-28

sneema

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

HIGH ENERGY IGNITION LEAD - REPAIR  
REPLACEMENT OF DEFECTIVE COMPONENTS

MODIFICATION NO. OL.8778C

1. Effectivity

<u>I.P.C.</u>	<u>FIG./ITEM</u>	<u>PART NO.</u>
74-21-01	1 10C	B.495471

2. Introduction

A. General.

- (1) This repair applies when there is a requirement to replace one or more unacceptable items of ignition leads with cables incorporating crimped contact caps.
- (2) Items listed in Table 402 must be renewed, irrespective of condition, whenever an ignition lead is dismantled.
- (3) In the assembly procedure, component names are followed with the corresponding Fig./Item number of the Illustrated Parts Catalogue.
- (4) Dimensions on illustrations are given in INCHES followed by (MILLIMETRES).
- (5) Consumable materials required during this repair are listed in Table 401.

### 3. Instructions

#### A. Disassemble HE Ignition Lead (Ref.Fig.401).

- (1) At one end of the cable, pull the contact cap to expose the conductor cable, then cut the cable and remove the contact cap.
- (2) Remove the contact cap at the other end of the cable in a similar manner.

- (3) Remove the lockwire connecting the ferrule to the elbow then unscrew the connection and remove the elbow.
- (4) Withdraw the cable from the flexible conduit assembly.
- (5) Remove clips and glasscloth tape, then draw back the convoluted tube to reveal the flexible metal conduit.
- (6) Unsolder the flexible metal conduit from the ferrule and connector.
- (7) Separate all items, then discard the items listed in Table 402 plus any defective items.

I.P.C. FIG./ITEM	DESCRIPTION	QUANTITY
-	Cable Size 10 ESW-O5D BA-01-050 (RR part No.U323899)	-
3-20	Contact Cap	2
3-60	Seal	1
3-80	Clip	4

Items to be Renewed Irrespective of Condition  
Table 402

B. Assemble HE Ignition Lead (Ref.Fig.401 and 402).

- (1) Obtain replacements for the defective items and the items listed in Table 402. Refer to para.5 for part numbers.

OLYMPUS 593

MK.610-14-28

SNECMA

OVERHAUL

- (2) If the convoluted tube is to be renewed measure the length of the discarded tube and cut the replacement tube to the same length. Actual length of the tube is 1.00 in. (25,4 mm) greater than the dimension between the ferrule and the connector.
- (3) If the flexible metal conduit is to be renewed, cut and prepare the replacement conduit as follows:
  - (a) Remove pre-tinned end from the replacement conduit, (Refer to Para.5).
  - (b) Measure the length of the discarded conduit and cut the replacement conduit to the same length plus a sufficient amount for trimming after both ends have been tinned.
  - (c) Solder tin both ends of the conduit.
    - (i) Insert a removeable mandrel into the conduit end to prevent solder entering the bore.
    - (ii) With the temperature of the solder pot at 300 to 325 deg.C, dip the conduit end into the solder to provide a tinned length, after final trimming, of approximately 0.5 in. (12,7 mm).
- NOTE: A layer of french chalk on the surface of the molten solder will minimise the formation of dross.
- (4) Solder the ferrule (3-50) to the end of the conduit.
- (5) Feed the convoluted tube and clips (3-80) over the conduit to abut the ferrule.
- (6) Draw back the convoluted tube to expose the other end of the conduit in readiness for installation of the connector (3-40).

- (7) Assemble and solder the connector to the conduit, then position the convoluted tube to abut the connector.
- (8) Wrap 0.300 in. (7,62 mm) wide glasscloth tape around the ferrule end and the connector end to obtain a diameter equal to that of the convoluted tube.
- (9) Wrap 1.00 in. (25,4 mm) wide glasscloth tape two turns overall at the positions shown.
- (10) Locate the clips on the tape, as shown and secure with the approved pliers.
- (11) If new convoluted tube has been used, attach marker tape (Ref.Fig.402).
  - (a) Attach the clip (3-85) to the marker tape (3-90C) (Detail A).
  - (b) Pass the tape around the convoluted tube, pull tight, then flatten one lug at each end of the clip (Detail B).
  - (c) Fold the tape back and flatten the two other lugs of the clip.
  - (d) Fold the tape forward then trim it, leaving sufficient length to tuck under the first fold (Detail C).
  - (e) Tuck the trimmed end under the first fold and press down firmly to ensure snug fit at the lug location.
  - (f) Apply silicone varnish to the marker tape at the clip location.
- (12) Assemble contact cap to one end of cable (Ref.Fig. 402).
  - (a) Remove the insulation from the end of the cable to expose 0.266 to 0.246 in. (6,75 to 6,25 mm) of the conductor (Detail D); use the Ideal Stripmaster.

OVERHAUL

- (b) Assemble the insulator (3-30) to the cable end.
- (c) Lightly grip the contact cap (3-20) in the jaws of an approved crimping tool as shown (Detail E).
- (d) Insert the prepared cable into the contact cap with the insulation abutting the cap end.
- (e) Check that the conductor is visible through the inspection hole then close the crimping tool jaws and complete the crimping operation.
- (13) Feed the unprepared end of the cable into the elbow assembly (3-70) and pull it through until the cable insulator abuts the elbow.
- (14) Feed the unprepared end of the cable into the ferrule end of the conduit assembly, then connect the ferrule to the elbow and hand-tighten.
- (15) Assemble the insulator (3-30) to the unprepared end of the cable.
- (16) Straighten the cable and conduit then, with the cable lightly tensioned, cut it to length leaving 0.100 to 0.177 in. (2,50 to 4,50 mm) protruding from the insulator (Ref.Fig.402, Detail F).
- (17) Dismantle the lead and remove the insulation from the end of the cable to expose 0.266 to 0.246 in. (6,75 to 6,25 mm) of the conductor. Replace the severed bead of insulation to protect the conductor.
- (18) Finally assemble lead.
- (a) Ensure that the insulator (3-30) is assembled to the cable.
- (b) Pass the bare end of the cable into the elbow assembly (3-70) and pull it through until the cable insulator abuts the elbow.
- (c) Assemble the seal (3-60) over the cable, then feed the cable into the ferrule end of the conduit.

OVERHAUL

- (d) Connect the ferrule to the elbow and torque-tighten to between 124 and 175 lbf in. (14 and 20 N.m) then wire-lock.
  - (e) Assemble the insulator (3-30) to the cable and remove the severed bead of insulation.
  - (f) Coil the assembly and pull the cable tight.
  - (g) Ensure that there is no damage to the strands of the conductor, then install the contact cap (3-20) and follow the crimping procedure as in paragraph (12).
- (19) Inspect the lead.
- (a) Straighten the lead and check that the central conductor is not in tension (i.e. springs must not be compressed).

HIGH ENERGY IGNITION LEAD - ASSEMBLY1. General

- A. This section contains the procedure for the assembly of the high energy ignition leads.
- B. Throughout the text special tools are quoted by their Ref.No. e.g. (Tool 1234). For a complete list of tooling required for assembly and for the Manufacturers Part No., refer to Special Tools, Fixtures and Equipment Table 1001.
- C. During the assembly procedure, reference will be made to the Illustrated Parts Catalogue (I.P.C.) to identify those items where the nomenclature does not positively identify them, due to the duplication of the title. When the item is a part of the breakdown of the text concerned, the item will be identified as insulator (3-30), the 3 referring to the I.P.C. Fig.No. and the 30 referring to the Item No.
- D. For the testing procedure following assembly, refer to 71-00-02, Testing.

 2. Assembly of High Energy Ignition Lead  
 (Pre SB.OL.593-74-9084-19 standard)

- A. Preparation of Cable (Ref.Fig.501).

NOTE: All reference to details are contained in Figure 501.

- (1) Strip the insulation from one end of the uniplug cable to a length of 1.000 in. (25,4 mm). (Detail A).
- (2) Screw the insulator (3-30) onto the cable until the insulation protrudes. (Detail C).

NOTE: It is permissible to lightly trim the leading insulation 0.500 in. (12,7 mm), if difficulty is encountered when installing the insulator onto the cable. (Detail B).

- (3) Install the contact cap (3-20) over the cable core to abut the insulation. (Detail D).
- (4) Cut off the surplus core and splay the separate wires. Solder the core to the contact cap, refer to method of soldering (Ref.para.3). Flush finish to between 0.122 and 0.130 in. (3,1 and 3,3 mm) to show witness of face of the contact cap and polish. (Detail E).

OVERHAUL

- (5) Screw back the insulator to abut the shoulder of the contact cap. (Detail E).

#### B. Preparation of Conduit.

NOTE: All reference to details are contained in Figure 502.

- (1) Cut the flexible metal tubing and the convoluted tubing (3-100) to length sufficient to give a finished length between 111.000 to 111.500 in. (2832,1 to 2819,4 mm). (Ref.Fig.503).
- (2) Insert both ends of the convoluted tubing, for a length of 0.500 in. (12,7 mm) approximately, into solder for approximately 10 seconds, withdraw and shake off the excess dross. (Detail A). (Ref.Fig.502).

NOTE: Working temperature of the solder pot to be between 300° C and 325° C. It is recommended that a layer of french chalk on the molten solder will minimise the formation of dross.

- (3) Insert a mandrel of the required diameter into the tubing and smooth out the convolutions using a duster cloth.
- (4) Cut the ends square to the dimensions shown. (Detail A).
- (5) Solder tin both ends of the flexible metal tubing to a length of 0.500 in. (12,7 mm) approximately. (Detail B. Refer to the method of soldering (Ref.para.3).
- (6) Solder the flexible metal tubing to the integral ferrule of the connector (3-40). (Detail C). Refer to the method of soldering (Ref.para.3).
- (7) Install the convoluted tubing over the metal tubing with the appropriate identification sleeve (3-90) and secure in position with a clip (3-80). (Detail C).
- (8) Draw back the free end of the convoluted tubing and solder the metal tubing to the ferrule (3-50). (Detail D). Refer to the method of soldering (Ref.para.3).

- (9) Draw convoluted tubing over the ferrule and secure in position with a clip (3-80). (Detail E).

C. Assembly of the Elbow Assembly End (Ref.Fig.503).

NOTE: All reference to details are contained in Figure 503.

- (1) Assemble the elbow assembly (3-70) over the bared end of the cable until it abuts the insulator (3-30).
- (2) Assemble the seal (3-60) over the bared end of the cable and locate in the union sleeve of the elbow assembly. (Detail A).
- (3) Insert the bared end of cable through the previously assembled conduit starting at the end with the ferrule (3-50).
- (4) Draw the elbow assembly to the ferrule, engage the threads dry and torque-tighten to between 10 and 15 lbf ft. (13,6 and 20,3 Nm). (Detail B).
- (5) Pull the cable and tubing straight, then cut off the cable to required length.

D. Assembly of the Connector Assembly End (Ref.Fig.501).

NOTE: All reference to details are contained in Figure 501.

- (1) Strip the insulation from the end of the uniplug cable to a length of 1.000 in. (24,4 mm). (Detail A).
- (2) Screw the insulator (3-30) onto the cable until the insulation protrudes. (Detail C).

NOTE: It is permissible to lightly trim the leading insulation 0.500 in. (12,7 mm), if difficulty is encountered when installing the insulator onto the cable. (Detail B).

- (3) Install the contact cap (3-20) over the cable conductor to abut the insulation. (Detail D).
- (4) Cut off the surplus conductor and splay out the separate wires. Solder the conductor to the contact cap. Refer to the method of soldering (Ref.para.3). Finish flush to between 0.122 and 0.130 in. (3,1 and 3,3 mm) to show witness of face of the contact cap and polish. (Detail E).

- (5) Screw back the insulator to abut the shoulder of the contact cap. (Detail F).

E. Final Assembly (Ref.Fig.503).

NOTE: All reference to details are contained in Figure 503.

- (1) Wire-lock the ferrule (3-50) to the elbow assembly (3-70). (Detail C).
- (2) Install protective caps on the lead ends.
- (3) Install in a clean, dry container until required for use.

3. Method of Soldering Ignition Leads (Pre SB.0L.593-74-9084-19 standard)

A. Preparation.

- (1) The surfaces to be soldered are to be free from grease and cleaned by careful scraping or by use of a fine grade of emery cloth.

B. Soldering.

- (1) Use a heated copper bit of a convenient size to localise the heat and avoid damage to the adjacent components.
- (2) Use solder, type LS4 and flux, type Alcho-re.
- (3) When soldering fine wires, care is to be taken to prevent the solder running down the wire and forming a rigid sleeve.
- (4) After soldering is completed apply a neutralizer and clean the part with a dry, nap-free cloth or air blast.

## HIGH ENERGY IGNITION LEAD - TESTING

### 1. General

The tests detailed in paragraph 3. are to be carried out after Inspection/Check procedures have been satisfactorily completed during overhaul or repair of the assembly.

The equipment listed in paragraph 2. is required to carry out the electrical tests detailed in paragraph 3. The high voltage test set is adjusted to a 5kV peak (0.8 mm) and consists of an induction coil with an enclosed R.A.E. 0.25 in. (6,35 mm) ball gap, with power supplied by a 12V battery.

### 2. Tools and Equipment

High voltage test set

Continuity test set

Ohmmeter.

12V battery fully charged, with associated leads.

Bonding resistance tester.

### 3. Test High Energy Ignition Lead

#### A. Pre-Test Procedures.

(1) Ensure the high energy ignition lead is free from damage.

(2) Test the high voltage test set as follows:

(a) Hold the test leads apart and switch on the high voltage test set, the ignition coil will cause a low frequency spark to take place across the ball gap. Touch the test leads together and the spark should be immediately shorted out.

TESTING

74-21-01

Page 701

Dec 31/00

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

## B. Test Procedure.

## (1) High voltage test.

- (a) Attach one test lead to the elbow of the high energy ignition lead and the other test lead to the lead terminal contact cap at one end. Switch on the high voltage power for a period of at least one minute and check the ball gap for sparking.

If the insulation of the lead under test is satisfactory a spark will take place at the ball gap, if no spark takes place the insulation is defective.

## (2) Continuity test.

- (a) Connect the leads of the continuity tester to each end of the high energy ignition lead and ensure that continuity exists. During this test gently agitate the high energy ignition lead to reveal any discontinuities.

## (3) Bonding resistance test.

- (a) Attach the leads of the bonding resistance tester, one at the rear of the ferrule at the HEIU end and the other at the elbow at the igniter end of the high energy ignition lead. With the use of an ohmmeter ensure continuity exists, the resistance should not be greater than 0.05 ohms.

## (4) Completion of test procedure.

- (a) Reject the igniton lead if it fails to meet any of the test requirements.

ENGINE IGNITER PLUGS - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

CLEANING

74-21-02

Page 201

OLYMPUS 593

MK.610-14-28

OVERHAUL

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## AIR TUBES - INSPECTION/CHECK

### 1. General

- A. Each item in this chapter is given a two-part identification; thus, 302-20 refers to Figure 302 and to Item 20 called out on that figure. Each item may be further identified by its Part Number by the use of Table 303, which cross-refers figures in this chapter to the equivalent chapter and figure in the Illustrated Parts Catalogue (I.P.C.); the called-out item number will be the same on both figures.
- B. All items which will be crack tested are listed in Tables 301 and 302.
- C. Dimensional checks are cross referenced to the equivalent Fits and Clearances Schedule (F.C.S.) chapter against the item concerned.
- D. When the inspection of an item discloses a minor defect that requires rectification, it is defined as 'Accept after repair'. On all such occasions the item must be rectified in accordance with Standard Practices 72-09-22 Repair. Where a Ref.No. follows 'Accept after repair' e.g. (Ref.72-21-01 Repair No.1), a specific Repair Scheme is available to which the item must be rectified. Items that are rejected, or for which a repair scheme is not currently available, should be held at the discretion of the operator, as service experience may prove the need for a repair.
- E. On completion of a repair, rectification or test, the item(s) must be inspected, to ensure that the necessary work has been satisfactorily completed.

### 2. General Inspection

- A. Inspect all items illustrated in this chapter, whether specified or not, in accordance with Standard Practices (Ref.72-09-00 Inspection/Check). In addition, carry out the inspections detailed for the specified items, from para.4 onwards.
- B. Inspection terms used in this chapter are explained in Standard Practices (Ref.72-09-00 Inspection/Check).

### 3. Crack Detection

- A. Magnetic Particle Crack Detection.
  - (1) Submit the items listed in Table 301 to crack detection in accordance with the process quoted.

INSPECTION/CHECK

(2) Fretting on lands.

(a) Up to 0.030 in.  
(0,760 mm) reduction  
in diameter.

Accept after  
repair.

C. Inspect Seal Ring Location Bores.

(1) Fretting.

(a) Producing a step less  
than 0.005 in. (0,130 mm)  
deep.

Accept after  
repair.

(2) Nicks, burrs and light  
scoring.

Accept after  
repair.

D. Inspect Abutment Flanges.

(1) Nicks, burrs and scoring.

Accept after  
repair providing  
sealing  
capabilities are  
unimpaired.

(2) Wear.

(a) Elongation of bolt holes  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

E. Inspect Bracket Attachment Flanges.

(1) Nicks and burrs.

Accept after  
repair.

(2) Wear.

(a) Attachment face thickness  
reduced not more than  
10 per cent.

Accept.

(b) Bolt holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

F. Inspect Elbow and Tee Adapter Piece.

(1) Nicks and burrs.

Accept after  
repair.

5. Retaining Plates (302-170, 303-130, 308-440, 310-110/130, 311-130, 312-50, 313-40, 319-80/240, 320-110/260, 321-280)

A. Inspect Retaining Plate.

- (1) Nicks and burrs. Accept after repair.
- (2) Wear.
  - (a) Attachment face thickness reduced not more than 10 per cent. Accept after repair.
  - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

6. Make Up Piece Assembly 302-260

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Tube Abutment Faces.

- (1) Scoring. Accept after repair providing sealing capabilities are unimpaired.

C. Inspect Attachment Flange.

- (1) Wear.
  - (a) Reduction of flange thickness of less than 10 per cent. Accept after repair.
  - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
- (2) Nicks, burrs and light scoring.
  - (a) On the spigot location of the flange. Accept after repair providing sealing capabilities are unimpaired.

7. Brackets (305-50/60/160/170/220, 307-180, 308-70/115, 309-90, 311-110, 313-100/110, 318-30/40/90/100, 321-180/230/390, 322-470)

A. Inspect Brackets.

(1) Wear.

- |     |  |                      |
|-----|--|----------------------|
| (a) | Attachment face thickness reduced not more than 10 per cent. | Accept.              |
| (b) | Bolt holes elongated not more than 0.030 in. (0,760 mm).     | Accept after repair. |

(2) Nicks and burrs.

Accept after repair.

(3) Distortion.

- |     |                           |                                       |
|-----|---------------------------|---------------------------------------|
| (a) | Distorted from true form. | Accept if compatibility is preserved. |
|-----|---------------------------|---------------------------------------|

(4) Scoring.

- |     |  |   |
|-----|--|---|
| (a) | Not more than 0.010 in. (0,250 mm) in depth. | Accept after repair providing material thickness is not reduced by more than 10 per cent. |
|-----|--|---|

8. Ducts (304-10/60, 305-10/180/200, 312-10, 313-10, 318-10/50, 319-10, 321-190, 324-10/100)

A. Inspect Duct (Ref.72-09-00 Inspection/Check Rigid Tubes).

B. Inspect Threads (Ref.72-09-00 Inspection/Check).

C. Inspect Abutment Faces.

(1) Nicks, burrs and scoring.

Accept after repair providing sealing capabilities are unimpaired.

(2) Wear.

- |     |  |                      |
|-----|--|----------------------|
| (a) | Elongation of bolt holes not more than 0.030 in. (0,760 mm). | Accept after repair. |

D. Inspect Sealing Ring Locating Bores.

(1) Fretting.

(a) Producing a step less than 0.005 in. (0,130 mm) deep. Accept after repair.

(2) Nicks, burrs and light scoring. Accept after repair providing sealing capabilities are unimpaired.

E. Inspect Bracket Attachment Flanges.

(1) Nicks and burrs. Accept after repair.

(2) Wear.

(a) Attachment face thickness reduced not more than 10 per cent. Accept.

(b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept.

F. Inspect Seal Ring Location External Diameters and Adjacent Lands.

(1) Fretting on lands.

(a) Up to 0.030 in. (0,760 mm) in diameter. Accept after repair.

(2) Nicks, burrs and light scoring in seal ring locations. Accept after repair.

G. Inspect External Finish (304-10/60, 305-10/200, 313-10, 318-18/50) (Ref.72-09-04 Repair for Areas with External Finish and the Procedure for Application of Finish).

NOTE: To enable the crack detection (fluorescent dye) to be carried out, the high heat resisting aluminium enamel finish will have been removed during cleaning.

9. Bracket Assemblies (305-70, 307-290)

- A. Inspect Captive Nut and Retainer (Ref.72-09-00 Inspection/Check).
- B. Inspect Threads (Ref.72-09-00 Inspection/Check).
- C. Inspect Bracket Assembly.
- (1) Nicks, burrs and fretting. Accept after repair.
  - (2) Wear.
    - (a) Attachment face thickness reduced more than 10 per cent. Reject.
    - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.
  - (3) Damage.
    - (a) Any distortion from true form. Reject.

10. Elbow (306-20, 319-130)

- A. Inspect Abutment Faces.
- (1) Fretting.
    - (a) Reduction of flange thickness of less than 10 per cent. Accept after repair.
  - (2) Scoring, nicks and burrs. Accept after repair providing sealing capabilities are unimpaired.
  - (3) Wear.
    - (a) Attachment face thickness reduced not more than 10 per cent. Accept.
    - (b) Bolt holes elongated not more than 0.030 in. (0,760 mm). Accept after repair.

B. Inspect Sealing Ring Locating Bores.

(1) Fretting.

- |  |                      |
|--|----------------------|
| (a) Producing a step less than 0.005 in.<br>(0,130 mm) deep. | Accept after repair. |
|--|----------------------|

C. Inspect for Dents (Ref.72-09-00 Inspection/Check).

11. Thermal Insulation Blanket (306-50/60)

A. Inspect Spot Welding.

(1) Damage.

- |  |         |
|--|---------|
| (a) Broken spot welds or parted seams. | Reject. |
|--|---------|

B. Inspect Blanket.

(1) Damage.

- |  |         |
|--|---------|
| (a) Tears, punctures or irregular dents. | Reject. |
| (b) Dents of smooth contour.             | Accept. |
| (c) Powdering and collapse of filler.    | Reject. |

NOTE: Press blanket with finger tips and note any lack of "cushion" effect.

12. End Fitting Assembly (307-240)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Flange.

(1) Wear.

- |  |                      |
|--|----------------------|
| (a) Attachment face thickness reduced not more than 10 per cent. | Accept.              |
| (b) Bolt holes elongated not more than 0.030 in.<br>(0,760 mm).  | Accept after repair. |

(1) Nicks and burrs.

Accept after  
repair.

13. Seal Plate (308-80)

A. Inspect Abutment Face.

(1) Scoring.

(a) Less than 0.005 in.  
(0,130 mm) deep and  
not extending right  
across the sealing  
face.

Accept after  
repair providing  
the sealing  
capabilities are  
unimpaired.

(2) Wear.

(a) Bolt holes elongated  
not more than 0.020 in.  
(0,500 mm).

Accept after  
repair.

B. Inspect General Condition of Seal Plate.

(1) Nicks and burrs.

Accept after  
repair.

14. Multiple Connector Assembly (309-100)

A. Inspect Threads (Ref.72-09-00 Inspection/Check).

B. Inspect Attachment Flanges.

(1) Wear.

(a) Attachment face thickness  
reduced not more than 10  
per cent.

Accept.

(b) Bolt holes elongated  
not more than 0.030 in.  
(0,760 mm).

Accept after  
repair.

TUBES - INTERMEDIATE CASE TO EXHAUST DIFFUSER - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

TUBE - INTERMEDIATE CASE TO HP TURBINE BEARING - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N,  
INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COM-  
PONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY  
COATINGS. THE NITRIC ACID USED IN PROCESSES J, L  
AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME  
TYPES OF COATING, MAKING REPLACEMENT OF THE COATING  
NECESSARY.

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.

## OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 75-501

This TR is the first RST for section 75-01-03

### REASON FOR ISSUE:

To introduce a repair scheme for repairing a fretted bore (MRA 98).

### ACTION

B.E.O.L. REPAIR

RST 4014 DUCT-AIR UNIT:-  
REPAIR TO FRETTED BORES

### PROCEDURE:- PART 1 REPAIR BY PLASMA COATING

1. Suitably secure to a machine, clock up on unworn part and machine to clean up. Observe min. wall thickness. See Fig. 1.
2. Prepare location prior to plasma spray, as per T.S.D. 594 - 704.
3. Plasma spray location as per T.S.D. 594 - 704, as follows:-
  - a) Apply Metco 450, 0.007 - 0.008 thick to MSRR 9507/5.
  - b) Apply Stellundum 52F to MSRR 2507/1 sufficiently thick to achieve final dimensions. See Fig. 1.
4. Machine to final dimensions. See Fig. 1.
5. Remove excess plasma coating.
6. Inspect coating for adhesion and cracks as per T.S.D. 594 - 704.
7. Finally inspect.

### PART 2 REPAIR BY REPLACEMENT.

1. Remove protective treatment as per overhaul manual.
2. Suitably secure duct and remove defective part, by cutting, as per Fig. 2.
3. Manufacture make-up piece, using BSEM 528 section 2 x 16 SWG (.064) x .600 wide.

1 May 1981

TR.75-501  
75-01-03  
RST 4014  
TR. Page 1 of 3

# British airways

CONCORDE

TR.NO. 75-501 (cont'd)

4. Form to existing profile the make-up piece and butt weld joint using Argon Arc process and filler rod F.I.W. Ref. MSRR/9500/5.
5. Heat treat make-up piece to  $750^{\circ}\text{C} \pm 10^{\circ}\text{C}$  for 10 mins.
6. Assembly make-up piece to duct.
7. Butt weld in position, ensuring make-up piece weld joint is at  $90^{\circ}$  to existing line using manual Argon Arc process and MSRR 9500/5 filler rod.
8. Magnetic particle inspect, as per standard practices.
9. Adjust make-up piece, by machining or grinding, to produce dimensions, after welding.
10. Assemble replacement housing seal B341032. See Fig. 3.
11. Butt weld in position, using manual Argon Arc process and MSRR 9500/5 filler rod.
12. Magnetic particle inspect, as per standard practice.
13. Heat treat for 2 hrs. at  $750^{\circ}\text{C} \pm 10^{\circ}$ , cool in air.
14. Complete to standard drawing B341042 for final machining, pressure test and protective treatment.
15. Final inspect.

THE ABOVE IS WRITTEN AS PER SEDP/CLY/317.

AIR DUCT ASSEMBLY - REPAIR BY REPLACEMENT  
OF SEAL HOUSING

MODIFICATION NO.0L.8804C

1. Effectivity

<u>I.P.C.</u>	<u>Fig/Item</u>	<u>Part No.</u>
75-01-03	1 60	B.925601

2. Introduction

A. General.

- (1) This repair describes the procedure for removing the seal housing and adjacent duct, and welding on replacement parts.
- (2) Dimensions are shown thus, INCHES (MILLIMETRES) in tables and illustrations.
- (3) Refer to Chapter 72-09-00, Repair, for all standard practices applicable to this repair.
- (4) Remove sharp edges 0.004 to 0.020 in. (0,10 to 0,51 mm) unless otherwise stated.
- (5) Tolerances on machined dimensions are plus/minus 0.010 in. (0,25 mm) unless otherwise stated.
- (6) Tolerances on all angles are plus/minus 2 degrees unless otherwise stated.
- (7) Surface texture is to be 125 micro-inches (3,2 micrometres).
- (8) All tools referred to by item number in procedural steps are detailed in para.4.
- (9) Protect the component against corrosion after each operation, and place in a container for protection against damage during transit between operations.
- (10) ALL TASKS identified in this instruction are in the Engine Overhaul Processes Manual (TSD 594-J).

## B. Repair Limitations.

None.

3. Instructions

## A. Remove Aluminium Paint.

- (1) Remove the aluminium paint using the method instructed in Chapter 72-09-00 Cleaning, and using process F.

## B. Inspect.

- (1) Crack test the duct using the fluorescent dye penetrant process specified for this component in Chapter 75-01-03 Inspection/Check.

## C. Machine.

- (1) Machine off the seal housing and part of the duct to a distance of 0.500 in. (12,7 mm) from the weld line (Ref.Fig.401). The machined end must be square to the axis of the duct to within 0.0015 in. (0,038 mm).
- (2) Remove burrs and sharp edges.
- (3) Crack test the duct using the fluorescent dye penetrant process specified for this component in Chapter 75-01-03 Inspection/Check.

## D. Produce Additional Section.

- (1) Produce additional duct section B.499490 from BSEM528 or MSRR6629 (Firth Vickers 448) sheet material 0.068/0.060 in. (1,73/1,52 mm) thick, with a width sufficient to allow finish dimensions to be achieved (Ref. Fig.401 and 402). Use inert gas arc welding with filler rod MSRR9500/5 to butt-weld the joint.
- (2) Crack test the section using the fluorescent dye penetrant process specified for the duct assembly in Chapter 75-01-03 Inspection/Check.

- (3) Heat treat the section to 750 deg.C plus/minus 10 deg.C for 30 min. Cool in air.
- (4) Mark part number B.499490 on the section, using vibro-percussion marking as instructed in Chapter 72-09-00, Repair.

E. Weld.

- (1) Tack weld section B.499490 in position, then weld complete using inert gas arc welding with filler rods MSRR9500/5. The axial weld must be at 90 deg. to the duct welds (Ref.Fig.401).

F. Inspect.

- (1) Inspect for the satisfactory completion of the welding operation.
- (2) Crack test the duct using the fluorescent dye penetrant process specified for this component in Chapter 75-00-00 Inspection/Check.

G. Machine.

- (1) Machine section B.499490 to length, if necessary, in order to obtain the correct final dimensions after welding on the replacement seal housing (Ref.Fig.402).

H. Weld.

- (1) Withdraw from stores replacement seal housing B.341032.
- (2) Tack weld the housing into position on the duct, then weld complete using inert gas arc welding with filler rods MSRR9500/5.

J. Heat Treat.

- (1) Heat treat the duct assembly to 750 deg.C plus/minus 10 deg.C for 2 hours. Cool in air.

OLYMPUS 593

MK.610-14-28  
OVERHAUL

SNECMA

Printed in England

K. Clean.

- (1) Dry abrasive blast the duct assembly using the process instructed in Chapter 72-09-24 Repair.

L. Final Machining.

- (1) Machine the seal housing to the finish dimensions given in Fig.402. Remove burrs and sharp edges.
- (2) Crack test the duct assembly using the fluorescent dye pentrant process specified for this component in Chapter 75-00-00 Inspection/Check.

M. Pressure Test.

- (1) Assemble the pressure test tool ref. tool item 1 to the duct assembly (Ref.Fig.403).
- (2) Fill the duct with water at ambient temperature, and ensure that there is no air trapped in the duct.
- (3) Apply a steady pressure of 180 psi plus/minus 10% (1241 kPa plus/minus 10%) for 15 seconds. No leaks are allowable.
- (4) Release the pressure, then remove the pressure test tool and dry off the duct.

N. Identify.

- (1) Make SAL.B.499489 or R1 adjacent to the existing assembly part number using vibro-percussion marking as instructed in Chapter 72-09-00 Repair.

P. Apply High Heat Resisting Coating

Apply high heat resisting aluminium enamel as instructed in Chapter 72-09-04 Repair. Or apply high heat and corrosion resistant coating Type A or B, to areas designated in Chapter 72-09-04 Repair. Refer to TSD 594-J TASK 70-00-00-300-349 SUBTASK 70-00-00-380-349-001. Use OMat 7/46.

TUBES - HP COMPRESSOR CASE TO HP COMPRESSOR  
DIFFUSER CASE (LOWER) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.

OVERHAUL

- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.
- C. When an assembly item has attached parts that have certain protective finishes e.g. silver plating, the cleaning process for the assembly item may damage the finish of the part. To minimize the effect on the finish of the part, reduce the process immersion time to a minimum. If the finish is damaged, then the damaged finish will have to be replaced or reconditioned.

## OLYMPUS 593 OVERHAUL MANUAL

Temporary Revision No. 75-503

This TR is the first RST for section 75-01-04

### REASON FOR ISSUE:

To introduce a repair for a cracked mounting bracket (MRA 128)

### ACTION

B.E.O.L. REPAIR

RST 4031 BRACKET, ASSEMBLY OF,  
MOUNTING REPAIR OF CRACK BY ARGON ARC  
WELDING.

### PROCEDURE

1. Clean and prepare cracked area for welding in accordance with TSD 594/Op.407.
2. Argon Arc Weld using filler rod MSRR 9500/2 as per TSD 594/Op.407.
3. Crack detect using Fluorescent Penetrant method as per Overhaul Manual.
4. Hand dress back to original contours.
5. Visually inspect.
6. Vibro engrave RST 4031 adjacent to Part Number.
7. The above is written in accordance with OLY/SEDP/980.

Temporary Revision No. 75-504

This TR is the first RST for section 75-01-05

### REASON FOR ISSUE:

To introduce a repair to restore fretted surface in H.P. turbine bearing air duct (MRA 133).

### ACTION

B.E.O.L. REPAIR

RST 4036 DUCT ASSY:-  
RESTORATION OF FRETTED SURFACE  
BY CHROME PLATING.

### PROCEDURE:-

1. Strip chrome plate as per TSD 594-308 (if required).
2. Inspect, as per TSD 594-308.
3. If fretting still present, machine to dimensions in figure.
4. Prepare for hard chrome plate as per TSD 594-308.
5. Hard chrome plate as per TSD 594-308.
6. Inspect coating for cracking and adhesion as per TSD 594-308.
7. Machine to dimensions in figure.
8. Inspect as per Op.6.
9. Dimensionally inspect.
10. Vibro engrave RST 4036 adjacent to P/N.
11. The above is written in accordance with OLY/SEDP/912.

## TUBES - OIL TANK TO OUTLET SEAL PLATE - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items prior to cleaning and reassembled immediately afterwards. Items received in special cleaning containers should remain therein during the cleaning procedures unless otherwise stated.
- B. All items contained in this breakdown must be cleaned by the appropriate processes quoted in the table, to achieve a cleanliness to enable the Inspection/Check to be carried out correctly. Where alternative processes are quoted, the operator must decide what process to use depending on the amount of contamination of the item. Any item that is not cleaned satisfactorily must be recleaned by the appropriate process.

TUBES - HP COMPRESSOR DIFFUSER CASE AND EXHAUST DIFFUSER  
TO MULTIPLE CONNECTOR (LESS INTERNAL TUBE) - CLEANING

1. General

- A. Prior to commencing the cleaning refer to 72-09-00  
Cleaning for details of the cleaning processes referred  
to in Table 201.
- B. To ensure that all items within this breakdown that  
require cleaning and subsequent Inspection/Check are  
recognized, and identified by their Part Number, figures  
are provided which equate with the Illustrated Parts  
Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with  
the relevant Figure and Item Number in the same breakdown  
in the I.P.C. Items illustrated in the I.P.C. which are  
not illustrated in this breakdown, are those items which  
are either discarded at overhaul, or are normally assembled  
to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the  
figures, Table 201 does not list all items, but deals  
collectively with the items requiring the same cleaning  
process.
- D. On receipt of the items from disassembly, all protective  
blanks, covers etc. deemed necessary for the protection  
of the items will have been assembled and, in addition,  
many of the items will arrive in containers. Any special  
containers, blanks, covers etc. are listed in Table 202  
by their Tool Ref. No. e.g. (Tool 123). For the  
manufacturer's Part No. refer to the appropriate Table in  
Special Tools, Fixtures and Equipment Section.

2. Cleaning Components

- A. All blanks, covers etc. must be removed from the items  
prior to cleaning and reassembled immediately afterwards.  
Items received in special cleaning containers should  
remain therein during the cleaning procedures unless  
otherwise stated.
- B. All items contained in this breakdown must be cleaned by  
the appropriate processes quoted in the table, to achieve  
a cleanliness to enable the Inspection/Check to be carried  
out correctly. Where alternative processes are quoted,  
the operator must decide what process to use depending on  
the amount of contamination of the item. Any item that is  
not cleaned satisfactorily must be recleaned by the  
appropriate process.

## TUBE - EXHAUST DIFFUSER TO DUCT (RIGHT-HAND) - CLEANING

### 1. General

- A. Prior to commencing the cleaning refer to 72-09-00 Cleaning for details of the cleaning processes referred to in Table 201.
- B. To ensure that all items within this breakdown that require cleaning and subsequent Inspection/Check are recognized, and identified by their Part Number, figures are provided which equate with the Illustrated Parts Catalogue (I.P.C.). Thus, Fig.201 Item 10 equates with the relevant Figure and Item Number in the same breakdown in the I.P.C. Items illustrated in the I.P.C. which are not illustrated in this breakdown, are those items which are either discarded at overhaul, or are normally assembled to another item and are only called up by number.
- C. As all items requiring cleaning are illustrated in the figures, Table 201 does not list all items, but deals collectively with the items requiring the same cleaning process.
- D. On receipt of the items from disassembly, all protective blanks, covers etc. deemed necessary for the protection of the items will have been assembled and, in addition, many of the items will arrive in containers. Any special containers, blanks, covers etc. are listed in Table 202 by their Tool Ref. No. e.g. (Tool 123). For the manufacturer's Part No. refer to the appropriate Table in Special Tools, Fixtures and Equipment Section.

### 2. Cleaning Components

CAUTION: BEFORE USING HEAVY CLEANING PROCESSES J, L AND N, INVESTIGATE ALL REPAIRS CARRIED OUT ON EACH COMPONENT TO IDENTIFY THOSE HAVING PLASMA SPRAY COATINGS. THE NITRIC ACID USED IN PROCESSES J, L AND N WILL ATTACK THE ALUMINIUM CONTENT OF SOME TYPES OF COATING, MAKING REPLACEMENT OF THE COATING NECESSARY.
